TO

HIS MOST GRACIOUS MAJESTY

MAXIMILIAN II.,

KING OF BAVARIA.

SIRE,

Your Majesty, with that gracious sympathy ever so readily evinced on behalf of geographical science, has again been pleased to distinguish us with Royal favour by accepting the dedication of the present work, in which it has been our endeavour to contribute to the knowledge of physical geography by collecting the measurements of heights hitherto made in India and High Asia, and combining with the results of former observers the determinations made by ourselves during three years travel in those regions.

The mountain systems of the Himálaya, Karakorúm, and Kuenlúen, include the highest elevations of our globe; yet their geological character, so different from the volcanic nature of the Andes, and their climate so rapidly approaching with increased elevation that of the temperate, and even frigid zone, presented to us, though on a larger scale, surprising analogies with Alpine forms, and suggested, notwithstanding the distance from home, many a cheerful remembrance of the highland territories of your Majesty's dominions, our own native country.

With entire loyalty and profound respect we are

Your Majesty's

most faithful and obedient Subjects

JAGERSBURG, Sept. 1861.

THE AUTHORS.

PREFACE.

The compilation and computation of the existing hypsometrical materials for India and High Asia being now terminated, we are in a position to indicate by a few figures the data upon which our knowledge in this branch of science is based, up to the present month of November, 1861. This enumeration may be considered at the same time as a general outline of the labours hitherto completed in hypsometry by our predecessors and ourselves.

The present volume contains, in all, the heights of 3,495 points, of which 1,615 belong to India, and 1,880 to High Asia. The area over which they are distributed extends from the southern parts of Ceylon to the environs of Káshgar in Turkistán (from 6° to 39° Lat. N.), and from the eastern boundaries of Assám to Sindh (from 97° to 70½° Long. E. Gr.).

Of the 3,495 points mentioned above, there are 1,113 for which we had no other determination but our own; of these new data 378 belong to India and 735 to High Asia. Besides these, we had occasion to add 144 points, some of which were determined anew; others are points for which differential values only had been formerly given, and which we had now the opportunity of connecting with the level of the sea.

With reference to the transcription adopted, a detailed explanation was presented in Vol. I., pp. 66—70; the table of the alphabet used is also given at the beginning of this volume. For the transcription of the Tibetan names, we are greatly indebted to our brother EMIL, who for some time past has been occupied with the preparation of a work, in which he will separately publish a selection from our Tibetan materials.

We begin this Volume, in Part I., with the theoretical considerations on the method of observation and calculation; two diagrams are also added, showing the variation of the barometrical heights in the daily and yearly period. As practical results of this part, we may mention the remarks on hypsometrical instruments in general, and especially our careful comparisons of barometers and of boiling-point thermometers, which were constructed with the greatest accuracy, and on which each degree of the Centigrade scale was divided into 50 parts. We had occasion to make such observations at a camp on the Íbi Gámin, still at a height of 19,323 feet. The barometrical and trigonometrical tables (pp. 71—90) may, we hope, be found acceptable, especially for scientific gentlemen in India.

The heights are contained in Parts II., III., and IV. It was a matter of serious consideration, how to arrange so large a number of heights. In accordance with the system detailed p. 93, the extensive districts of India, the Himálaya, and Tíbet, with the Karakorúm and Kuenlúen, have been kept separate, and each of these groups was subdivided into areas, the limits of which are laid down on a map included in the present volume. In this map the arrangement and succession of the heights is indicated by lines drawn across the several areas. To facilitate, however, the forming of any other combination which might be

required for special purposes, an "Alphabetical Register of Heights" has been given, pp. 506—25.

The materials collected in this volume were, at the same time, the basis for a "General Hypsometrical Tableau" (pp. 473—505), in which we have attempted to compare the principal features of India and High Asia with those of the Andes and the Alps.

In our Atlas of Panoramas, Views, and Maps, seven plates of "Panoramic Profiles" are engravings, having special reference to the hypsometry of High Asia. The profiles are parts of the large panoramas, the most important of which will subsequently be given as complete landscapes, coloured, with foreground and lateral scenery. The representation in profile of numerous crests of snowy peaks in immediate succession, and their combination with the hypsometrical details given in this volume, are as yet, we believe, a novelty of the kind, and, it is to be hoped, will prove useful in completing the orographical tableau of these regions.

Following the principle adopted in our first volume, we here also present the details of our observations, as far as we consider them necessary. This is a plan which, though materially extending the typographical matter, is generally followed in similar works, as it renders possible a subsequent application of any, even minor improvement which may arise under the gradual progress of science. We have also taken care to give a list of the different observers, together with their important labours; to these must be added the recent operations of the Great Trigonometrical Survey, under Captain T. G. MONTGOMERIE, in Bálti and Ladák, the results of which, we venture to hope, will shortly be published.

It affords us particular pleasure to repeat our acknowledgements for the valuable assistance, both official and private, that we have received in furtherance of the work contained in this volume: in

England, by LORD STANLEY, his successor SIR CHARLES WOOD, and the heads of the various departments of the India Office; in India, by General SIR ANDREW WAUGH and Colonel H. L. THUILLIER.

This volume was on the point of being published, when LORD WILLIAM HAY communicated to us the important news, that he had succeeded in his endeavours to recover Adolphe's manuscripts relating to his last and fatal journey to Turkistán. An account of their discovery by LORD HAY, to whom we have repeatedly had occasion to allude for his kind services in connection with our publications, is contained at the end of this volume. It is preceded by a report, in which the testimony of the several native witnesses examined in reference to the lamentable fate of our brother, has been carefully sifted by MR. THORNTON, in conjunction with COLONEL LAUGHTON and MESSRS. SCRIVEN and SMITH, two gentlemen of the Indian medical service.

The topographical portion of Adolphe's manuscript, which reached us January 10, 1862, will be embodied in our third volume.

ALPHABET USED FOR TRANSCRIPTION.

a (ā ä å a); ä; b (bh); ch (chh); d (dh); e (ē e ê); f; g (gh); h; i (ī î); j (jh); k (kh); kh; l (lh); m; n; o (ō õ); ö; p (ph); r (rh); s; sh; t (th); u (ū û); ü; v; y; z.

RULES OF PRONUNCIATION.

The system of the transcription adopted is fully explained in Vol. I, pp. 66–70.

Vowels.

1. a, e, i, o, u, as in German and Italian.
2. ü, ö, ü, as in German.
3. Diphthongs give the sound of the two component vowels combined. Diæresis is marked by the accent falling on the second of the two vowels.
4. - above the vowel makes the vowel long.

In general we considered it unnecessary to add this sign when the accent coincided with it, and the omission would not influence the correctness of the pronunciation.

Short vowels are not separately distinguished.

5. ˘ above a and e (a, e) is a sign of imperfect phonetic formation, similar to the open *a* in *bat*, and *e* in *herd*.
6. - below a indicates the deep sound, like *a* in *wall*.
7. ~ above a and o indicates a nasal sound, like *a* and *o* in the French words *gant* and *son*; also *ẽ*, *ĩ*, and *ũ* had to be introduced for marking the nasal sound of e, i, and u; in the nasal diphthongs *aũ* and *aĩ*, we make the sign over one only, though both sounds have the nasal sound.

Consonants.

1. b, d, f, g, h, k, l, m, n, p, r, s, t, are pronounced as in German and English [the variations occurring in the pronunciation of g, and h (in English) excepted].
2. h, after a consonant is an audible aspiration, except in *ch*, *sh*, and *kh*.
3. *ch*, as in English (*church*).
4. *sh*, as in English (*shade*).
5. *kh*, as *ch* in German (*hoch*).
6. *j*, as in English (*just*).
7. *v*, as the *w* in German (*Wasser*), being different from *v* in *voy*, and *w* in *water*.
8. *y*, as *y* in the English word *yes*, or *j* in the German *ja*.
9. *z*, soft, as in English.

Accents.

˘ marks the syllable on which the accent falls, whether the syllable be long or short

Alphabetical Registers.

In our alphabetical registers the letters follow the order of the alphabet, irrespective of the signs attached to them.

GENERAL REMARKS.

The measurements of heights and distances are given in English feet, and the miles also are English.

All the heights given are absolute, referring to the level of the sea.

The readings of the barometer are given in English inches, of the thermometer in Fahrenheit.

All the latitudes are North, the longitudes are referred to the meridian of Greenwich. Adopted longitude of the Madras Observatory: 80° 13' 56" East Green.

Abbreviations and signs used for the observers see pp. 4–10.

COMPARISON AND COMBINATION OF THE HEIGHTS OBTAINED.

It being our aim to present a general tableau, as complete and correct as possible, of the hypsometric conditions of India and High Asia, we have combined with our own observations¹ a carefully detailed compilation of all the existing materials which we were able to collect, though it has proved a much more laborious task than we had anticipated, on account of the materials being scattered throughout a great number of books, pamphlets, and maps, and even manuscripts, and provincial publications of India. We have, besides, embodied the results of previous observers, not only for such places and localities which we were ourselves unable to visit, but also for those actually determined by ourselves. In the latter case former determinations, when based on detailed measurements, offered at the same time a valuable control for our own observations, and could, moreover, be included in the means. The instances, however, where means could be taken were much less numerous than we had expected; they were, indeed, comparatively speaking, very rare, since for a critical examination it is of importance to know the original observer, and the nature of the method upon which his result is based, and these two points it was often very difficult, and sometimes impossible, to elucidate. We were also prevented from taking means at a vast number of places, because the spot of observation, or the "locality", as we propose to call it,

¹ Our *barometric* observations are contained in Nos. 13, 14, 15, and 16 of the manuscript volumes quoted in Vol. I., p. 8; the *trigonometric* determinations in Nos. 7 and 8.

had not been properly defined and described by the observer. The omission of the precise locality is often the occasion of much confusion and uncertainty, and many apparent discrepancies between the results of different observers at the *same place* would disappear, if the *locality* were known to which each observer's determination refers. In hilly, rocky, or much broken ground, it is possible for differences of several hundred feet to exist between "various localities" within a very short distance from each other.

In the selection of the locality, care should always be taken to fix upon a well defined object, such as the level of a river, tank, or spring, the floor of a house, or compound, the top of a hill, &c., in fact, any spot which may be easily recognised by a subsequent observer.¹ As, however, it is often impossible to put up the instruments in conspicuous positions, a local correction should then be applied, the amount of which can in general be easily ascertained by direct measurement, or in extreme cases, by minor triangulation.

In deducing the final results for places which had been determined by various observers, we have omitted the earlier observations, when evidently wrong, and, other things being equal, give the preference to trigonometric, over barometric, determinations.

Places near the sea shore, or very little above the sea level, and those situated in the deltas of rivers, have been in general omitted.

ABBREVIATIONS USED FOR THE OBSERVERS, BOOKS, AND MAPS.²

The observations made by ourselves during our travels are marked so as to distinguish the observer, or our establishments, when on a separate route.

Schl, Herm.	Hermann,	Schl, Hark.	Härkishen,
Schl, Ad.	Adolphe,	Schl, El.	Eleazar,
Schl, Rob.	Robert,	Schl, Man.	Máni.
Schl, Lt. A.	Lieutenant Adams,	About our establishment, see Vol. I., pp. 36—38.	

¹ When the nature of the object measured leaves no doubt as to the locality, we have omitted it altogether. Thus, when the height of a peak, or pass, is given, the summit is the locality signified; when we give as locality dak bāngalo, the floor of the bāngalo must be always understood.

² The authorities here quoted are arranged, not *alphabetically*, but *geographically*, according to the three principal divisions adopted by us.

A. INDIA AND HIMÁLAYA IN GENERAL.

For the materials collected, we use the following signs:

G.T.S. The heights of a large number of places, peaks, &c. have been determined by the Great Trigonometrical Survey of India, in connection with its other operations. The values obtained, however, have not yet been published in a separate form, but are to be found dispersed throughout the Revenue maps, the maps of the Indian Atlas, and various provincial publications. Besides those already published, we have been allowed, through the truly scientific zeal of Colonel Waugh and Major Thuillier, to extract a great number of original records. The locality for the places in India Proper, called "Tower Station," seems generally to be the top of the station mark, viz. on an average about 30 or 40 feet higher than the surrounding plain. In all cases where it was known, we subtracted the height of the tower and gave as locality: T.S. base = base of the tower station.

Schl., A.O. For the valley of the Brahmapútra, and the adjoining countries to the north and to the south of it, some heights, which had been determined by Assamese officers, were communicated to Hermann from Colonel Jenkin's Central Office at Gohátti.

Thorn. Thornton's well known Gazetteer of India, London, 1857, gives some heights nowhere else found by us.

Hook. Hooker's careful observations are contained in his "Himálayan Journals", London, 1854, Vol. II., pp. 465—473.

A. J. and name. Some isolated observations, made by various observers, and contained in the volumes of the Journal of the Asiatic Society of Bengál, or in the Asiatic Researches, are quoted as above, with the respective name of the observer.

I. A. and No. of sheet signifies: heights contained in the sheets of the Indian Atlas, without any further particulars being communicated.

P. C. and name. Private communications, received from various officers and gentlemen during our travels, will be found quoted under this head, together with the name of the senders.

B. INDIA.

Oldh. The heights in the Khássia Hills ascertained by Professor Thomas Oldham are given in his report: "On the Geological Structure of part of the Khási Hills,"

Calcutta, 1854. This report is reprinted in the "Memoirs of the Geological Survey of India," Vol. I., Calcutta, 1859. Determinations of a few points made in the Khássia Hills, 1827, by Lieutenant Fisher (see "Gleanings in Science", 1830, Vol. II., p. 69), have been omitted.

Ev. William Evans, Esq., Deputy Chief Engineer of the East Indian Railway, kindly gave us, in May, 1855, a manuscript-map containing the levels from Howrah (Calcutta) to Ranigánj, a distance of 122 miles.

Turnb. We are indebted to George Turnbull, Esq., for a manuscript-map of the Rajmahál line of the East Indian Railway; this map, received in April, 1857, shows the levels of the line between Bãrdván and the river Kurumnása. The levels of the East Indian Railway are all referred to the Howrah dock sill.

Ham. Sir Robert Hamilton communicated to the Asiatic Society the level of the different stations of the proposed railway between Súrat and Ágra (see Journal of the Asiatic Society of Bengál, 1856, p. 221).

Frankl. Capt. James Franklin adds to his memoir, "On the Geology of Bãndelkhând" (Vol. 18 of the Asiatic Researches), a table of barometrical heights, determined Nov. to February 1826-7. His point of reference and comparison was a G. T. S. station at Ságer, which he assumes as 2,195 feet above the level of the sea. But, after a careful examination, we find, that this G. T. S. station has only a height of 2,121 feet. Moreover, a comparison with our own observations shows Captain Franklin's determinations to be too high; we therefore have deducted from each of his observations 74 feet ($2,195 - 2,121 = 74$ feet), so that his heights will now be found nearer the truth.

Flem. Dr. A. Fleming, in his "Report on the Geological Structure of the Salt Range", gives a list of approximate heights for various places situated in or near the salt range. Some of his observations were made by a Fahrenheit thermometer divided into $\frac{1}{2}^{\circ}$, others by mountain barometers. The corresponding station was Calcutta, being more than 1,000 miles to the east. See Journal of the Asiatic Society of Bengál, Vol. XXII.

Walk. Lieutenant J. T. Walker, Bombay Engineers, gives a considerable number of heights, trigonometrically determined, and based upon the operations of the Great Trigonometrical Survey, in his maps of the "Military Survey of the Northern Trans-Indus Frontier", Calcutta, 1853. These maps, consisting of several sheets, are drawn

in the proportion of two English miles to the inch. We have applied to all heights on Walker's map a correction, the amount of which is indicated by himself. An account of Lieutenant Walker's Survey is published in the "Selections from the Public Correspondence of the Pānjāb Administration", Lahór, 1855, No. XXV. It is to be regretted that his elaborate account does not contain a list of the latitudes and longitudes determined.

Bomb. Cal. The Bombay Times Calendar for 1851 contains, in its third part, p. 6, a list of heights of various places situated in the Bombay Presidency. The source from which the heights are derived is not mentioned, but as some of them are also to be found on the respective sheets of the Indian Atlas, we believe them to have been determined trigonometrically. We have kept a separate mark for them.

Buist. In our manuscript journals we found some observations, copied by our late brother Adolphe from a source which is not specially named. These observations, based partly on barometer, partly on thermo-barometer readings, refer chiefly to Southern India, and were made, if we are not mistaken, by the late Dr. George Buist.

Syk. Some of the places determined by Colonel W. H. Sykes, in the Dēkhan and Southern India, are given in the Proceedings of the Royal Society, 1850, p. 354.

A considerable number of heights are collected and graphically represented in the "Barometrical Sections of India", by Dr. Edward Balfour, Madras, 1853. In addition to these hypsometric observations, the book contains many interesting and valuable data on the populations, products, &c., of India Proper. The observers mentioned by Balfour are:

Wils. Lieutenant Colonel J. Wilson.

Cull. Major General Cullen (now Resident at Travankūr).

Mountf. Captain F. Mountford.

Bab. Mr. G. B. Babington.

Ger. Captain A. Gerard. Besides the heights given in Balfour, Gerard's "Account of Koonawur", in the Himālaya, edited by George Lloyd, London, 1841, contains a great many heights.

Scott. Various heights are also to be found in Major F. W. Scott's map of the Peninsula of India, accompanying the "Routes in the Peninsula of India and of the adjacent Territories", Madras, 1853. Neither the locality to which the heights refer,

nor the authority, is given. Many are evidently taken from Balfour's barometrical sections; the rest seem to be approximations.

Eastw. Eastwick's Handbook for India, 2 Vols., London, 1859, contains several heights which we could find nowhere else. Mr. Eastwick does not quote the source from which they are derived.

Godd. Levels executed along the Godáveri, by Lieutenant Goddard, are contained in the "Selections from the Records of the Madras Government", Madras, 1855, under the title, "Lieutenant Haig, Report on Navigation of the Godáveri".

Baik. is the abbreviation we use for Baikie's book, "The Nilgherries", 2nd edition, Calcutta, 1857. In the Appendix, p. 1, he gives a table of heights of mountains in the Nilgiris, without, however, mentioning the source from which they are derived. Some of the heights quoted seem to be approximations only. There are also various data, dispersed throughout the pages of the book, which have been collected by ourselves.

F. and S. Professor Schmarda's interesting book, "Reise um die Welt, 3 Vols., Braunschweig, 1861", contains (Vol. I., pp. 587—590) a list of heights determined by M. de Fridau and Professor Schmarda. The locality is given in a few cases only, nor does it appear which was the corresponding station.

Fraser. The map of the Central province of Ceylon, exhibiting the situation of Coffee Estates, by General Fraser, contains a number of heights, about which no further particulars are known to us.

Tenn. Heights are also found in Sir James E. Tennent's well known "Ceylon", 2 Vols., London, 1859, in Vol. I., p. 15.

C. HIMÁLAYA AND TÍBET.

Pemb. Some heights in Bhután are contained in Captain R. B. Pemberton's "Report on Bhután", Calcutta, 1839.

Robins. Captain Robinson's heights in the environs of Kathmándu are calculated from observations taken by a native; the results are given in the Journal of the Asiatic Society of Bengál, 1837, Part II., p. 699.

Strach. The Strachey's (Capt. Henry, and Major Richard) have published a number of heights for Kāmáon and Gnári Khórsum in "Physical Geography of Western Tibet", London, 1854, and in the Journals of the Asiatic Society of Bengál, Vols. XVI. to XIX.

Russ. William Howard Russell, the well known correspondent of the *Times* during the Indian rebellion, gives some heights in his interesting book "My Diary in India" 2 Vols., London, 1860. The authority from which they are derived is not mentioned.

The Asiatic researches contain in Vols. 13 and 14 various heights, chiefly for the Himálaya of Kāmáon and Gārhvāl, trigonometrically determined by :

Herb. and Hodg. Captain J. D. Herbert, and Major J. A. Hodgson.

Webb. Captain Webb. To each of his heights we have added 72 feet for correction of the starting point from which they were derived. See Journal of the Asiatic Society, Vol. XVII., p. 532.

A considerable number of the points determined by Herbert, Hodgson, and Webb, have been recently revised by the G. T. S.

Mulh. Mr. J. Mulheran, first Assistant of the Great Trigonometrical Survey, presents, as Appendix to Mr. Barnes' "Report on the Settlement of Kángra", Lahór, 1855, a list of trigonometrical heights in Kángra and Kúlu.

Cunning. Several heights of places, peaks, &c., of the Western Himálaya and Ladák are given by Major A. Cunningham in his "Ladák", London, 1854.

Thoms. In Thomson's "Western Himálaya and Tibet", London, 1852, we find many heights quoted, some being those of the Gerards, Cunningham, and the Stracheys, the remainder being determined by Dr. Thomson himself.

Earlier observations made by Moorcroft and Trebeck,¹ Hügel,² Vigne, Jacquemont,³ Macardieu,⁴ Griffith,⁵ and others, are in general omitted, as they have been for the greater part corrected by later observers. When any of them, however, are mentioned, we give to them the following abbreviations:

M. and T.	— Moorcroft and Trebeck.	Jacq.	Victor Jacquemont.
Hügel.	— Baron Hügel.	Mac.	Macardieu.
Vig.	— Vigne.	Griff.	Griffith.

¹ Travels in the Himálayan provinces of Hindostán and the Panjáb, from 1819—1825. Edited by H. H. Wilson, 2 Vols., London, 1841.

² Travels in Kashmir and the Panjáb. Translated from the German by Major T. B. Jervis. London, 1845.

³ Voyage dans l'Inde. Journal. Paris, 1841.

⁴ Selections from the public correspondence of the administration for the affairs of the Panjáb. Lahor, 1853 Vol. I, p. 539.

⁵ Journals of Travels by the late N. Griffith, Esq., arranged by J. McClelland, Esq. Calcutta, 1847. Griffith's heights are also contained in Major Hough's expedition to Affghanistán. London, 1841.

The hypsometric results contained in the works of Mountstuart Elphinstone, Wood, Burnes, Lord, Lemessurier, and others, have also been omitted, as they refer to countries which we do not include in the hypsometry of India and High Asia.

Ab To heights which are evidently approximations only, the abbreviation "ab." about, is prefixed.

The following abbreviations are inserted between the name of the place and the latitude.

T. S. means Tower Station.

T. S. base, stands for the base of the tower (see p. 5).

H. S. inserted in a manner similar to the preceding T. S. — Hill Station.

To the hypsometric stations the latitude and longitude is generally added, or places in their immediate neighbourhood are referred to such determinations, so that the position of every locality can be considered as sufficiently defined.

These values are derived from various sources:

⊕ Latitudes and longitudes of places determined by the Great Trigonometrical Survey, are distinguished by this mark.

⌘ This sign is attached to those places, for which we have ourselves determined the geographical co-ordinates.

The latitudes and longitudes for places not distinguished by a sign are most carefully taken from the best existing maps (for India, from the Indian Atlas, for Blután, from Pemberton's own determinations, given in p. 208 of his Report on Bootan, Calcutta, 1839, and from Tassin's map, &c.).

All the longitudes in this volume have been referred by us to the Madras Observatory, for which we have adopted the value: $80^{\circ} 13' 56''$ E. Gr.

The heights are given in English feet.

II. BAROMETRIC AND THERMO-BAROMETRIC INSTRUMENTS.

- I. BAROMETERS: *a.* List. *b.* Construction. *c.* Mode of packing. *d.* Determination of the corrections. *e.* General Table of the corrections.
- II. THERMO-BAROMETERS: *a.* Description. *b.* List. *c.* Determination of the corrections by comparison with barometers. *d.* Fundamental determination of the corrections.
- III. ANEROIDS
- IV. THERMOMETERS

I. BAROMETERS.

a. List of the barometers. During our different journeys we used in all sixteen barometers. When starting from Europe, 1854, we had with us one syphon and two cistern barometers from Berlin, and three cistern barometers from London.

In March, 1855, we received at Calcutta, through the kindness of Major Thuillier, three mountain barometers by Newman, which were used by our assistants for corresponding observations.

In the following year, five cistern barometers by Pistor of Berlin, which had been most carefully executed under the superintendence of our friend, the late Baron Humboldt, reached us in Calcutta, and lastly, before starting for his last fatal journey, Adolphe received two more small mountain barometers by Troughton, probably from his friends at Pesháur.

The following are the Nos. we use for the barometers in our observations, together with the makers' Nos. and signatures.

We mark with an asterisk those which may be considered as standard barometers, from their having a large diameter of tube and cistern, and from keeping their correction unaltered.

No. given by us.	Maker's Name and No.	No. given by us.	Maker's Name and No.	No. given by us.	Maker's Name and No.	No. given by us.	Maker's Name and No.
1	*Greiner 1	5	*Adie 5	9	*Pistor 961	13	Newman 2
2	*Pistor 1	6	*Adie 6	10	*Pistor 962	14	Newman 3
3	Oertling 1	7	*Pistor 959	11	*Pistor 963	15	Troughton 1
4	Adie 4	8	*Pistor 960	12	Newman 1	16	Troughton 2

Barometer 1, Greiner, was a syphon, 2 to 16 were cistern barometers. Nos. 1 to 11 had millimetre scales and centigrade thermometers attached; Nos. 12 to 16 had the scales divided into English inches with Fahrenheit thermometers.

The scales of Adie's barometers, Nos. 4, 5, and 6, had been engraved from a correct standard, but without taking into account that the metre must be reduced to 32° Fahrenheit as its standard temperature. A careful comparison of their scale division with a standard measurement has given the following results:

Scale reading: Millimetres.	Correction to be applied.	Scale reading corrected.	Scale reading: Millimetres.	Correction to be applied.	Scale reading corrected.
760 0	- 0 5	759 5	490 0	- 0 2	489 8
700 0	0 4	699 6	380 0	- 0 1	379 9
600 0	- 0 3	599 7	300 0	0 0	300 0

b. *Construction of the barometers.* With reference to the general construction of the barometers, we add the following remarks:

Barom. 1, Greiner, had two microscopes with their magnifying glasses crossed with wire as in theodolites. By aid of these microscopes the relative position of the two arms of the syphon could be ascertained with the utmost nicety. When the instrument was inverted for transport, the shorter arm of the syphon was protected against the possible introduction of air, by the insertion in the orifice of a cork, through which a capillary tube was passed, so as to allow the mass of mercury to expand without resistance.

Each of Adie's barometers had a circular spirit level in the upper end, by which the vertical position of the instrument could be easily ascertained. Greiner's syphon barometer necessarily had its point of suspension eccentric, for, at different heights,

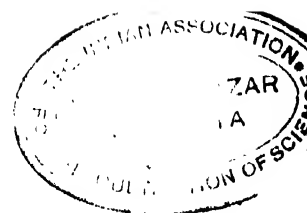

the relative position of the point of gravity was altered by the distribution of the mass of mercury in both arms of the syphon; though from the general size and weight of the wooden frame to which the syphon was attached, the deviation was too trifling to be appreciable. For the fundamental determination of errors, however, where the greatest possible accuracy must be sought for, or at very great heights, the exact vertical position of the barometer was always ascertained by means of a plummet.

The glass cisterns of Pistor's barometers were surrounded by metal cases with large apertures to admit the light. Of Adie's cisterns but a small part could be seen, being, as they were, almost entirely covered by the metal; nevertheless, they received light enough for the adjusting of the zero point, which was effected by means of broad edges. These *edges* we do not consider to be so serviceable as the large, but thin, *horn points* of Pistor's barometers, which never altered their form, always kept remarkably clean, and allowed of the greatest nicety in the adjustment.

The barometers 12 to 16 had narrow tubes, and no point for adjusting the zero in the cistern. We occasionally used them for a series of observations, but on each occasion had to compare them with standards, and apply the corrections thus directly ascertained to the readings. From the nature of the instrument, the correction varies with the height of the column, but it might also be deduced from the relative dimensions of tube and cistern, always provided that the primary error of the instrument remains constant. It is, however, impossible to alter the scale in perfect coincidence with the rise or fall of the level in the small cistern; and we were consequently obliged to use barometers of this construction as differential instruments only, the absolute values being as often as possible ascertained by direct comparison. The thermometers attached to the barometers we took care to have made not too sensitive; an over-susceptibility being calculated to interfere with their more immediate use, which is to indicate the temperature of the mercury in the barometer, without, at the same time, being influenced by external causes of a trifling character.

c. *Mode of packing.* The safety of the instruments was in great measure due to our mode of packing them. Indeed, in three instances only a glass tube was broken.

Every barometer had a strong wooden case for itself, and rested, in every direction,

on soft elastic springs. Two short springs were placed vertically above and below the case, and four larger ones pressed equally upon the four sides. The instruments were generally carried by kúlis, and, when we travelled by dāk, were placed upright, but inverted, in the carriage. We found it possible, though not without difficulty, altogether to avoid packing them upon horses, elephants, or camels.

When borne on a man's back, the wooden case was packed in a bag of strong cotton cloth with the necessary straps attached, and on the end to be kept uppermost was fastened a rough piece of wood—a mechanical contrivance which effectually served to prevent the bearers from carrying the instrument in a wrong position, if only from the very inconvenience of doing so.

d. *Determination of the corrections of the barometers.* During the whole of our journeys, the barometers were repeatedly subjected to careful comparisons. The general table of comparisons (p. 21) will show that we were fortunate in keeping the corrections pretty uniform, and that we always had in use one or more instruments in capital working order, though it is necessary to add that, on some occasions, which will be mentioned hereafter, several of them became useless by the sudden introduction of air into the tube. In the examination of the barometers, if several are found constantly to preserve the same difference, a very valuable criterion of their correctness is afforded, as in this case there is the greatest probability of none of them having undergone any material alteration; for, if air should have introduced itself into one or more of the tubes, the indications of the mercury would decidedly be altered in an *unequal* degree.

1. HERMANN, ADOLPHE, ROBERT. BOMBAY TO CALCUTTA, 1854-5.

We had with us barometers 1, 2, 3, 4, 5. Barometer 6 had been broken on the overland journey in the desert between Kairo and Suez.

We chiefly used barometers 1, 2, and 4; barometer 5, Adie, leaked so much, that we were obliged to empty it at Púna, January 4, 1855.

Barometer 3, Oertling, which, already at Berlin and at Kew, was found to contain some air, had a very variable correction, and was given up altogether from February 15, 1855.

Barometers	1, Greiner.	2, Pistor.	3, Oertling.	4, Adie.	5, Adie.
			1854, Dec. 10, to 1855, Jan. 3.		
Corrections (millim.)	+ 0.1	0.1	+ 0.7	+ 0.6	+ 0.3
			1855, Jan. 4 to Jan. 5.		
			+ 0.9		
			1855, Jan. 6 to Febr. 14.		
			+ 1.5		

Barom. 1, Greiner. Its correction is based: (*a*) on comparisons made at Berlin with Professor Dove's standard, 1854, June 13, corr. 0.0; (*b*) on 20 comparisons with the Kew¹ standard Newman No. 34, 1854, Sept., corr. + 0.1 millimetre.

This instrument was one of the best we had; the mercury always gave a clear metallic sound, on touching the glass; the later comparisons will equally show, that its correction remained the same until it was broken near the Säßer pass, 1856, August 3.

Barom. 2, Pistor. The correction (*a*) at Berlin, with Dove's standard, was - 0.1 millimetre; (*b*) at Bombay, 1854, November 25, with the observatory's standard No. 38 (which stands 0.014 Eng. inch too high)—0.1 millimetre.

Barom. 3, Oertling. The corrections were (*a*) at Kew, 1854, September, + 0.1 millimetre; (*b*) at Bombay, 1854, December 28 and 29, + 0.7 millimetre; (*c*) during the journey, the corrections, given above for the different periods, were ascertained by comparisons with barometer 2, Pistor.

Barom. 4, Adie. Its correction at Kew was + 0.4 millimetre, but we found by comparison with barometer 1, Greiner, after our arrival at Bombay, that the correction had become + 0.6 millimetre.

Barom. 5, Adie. We adopted the Kew correction, + 0.3 millimetre. The instrument was emptied, as mentioned above, at Puna, and filled again, March 1855, at Calcutta.

The following comparisons of the barometers, made during the journey from Bombay to Madras, will show that, after the application of the corrections, the readings of the barometers perfectly agree. When making comparisons of the barometers, we considered it advisable not to take the reading until after they had been in a fixed position for some little time, and also took care to place the instruments close

¹ Before we left England, our meteorological instruments were all sent to the Kew Observatory (under the charge of General Sabine) and their errors carefully ascertained by the late Mr. Welsh, who fully sustained the well deserved reputation of that establishment for accuracy and energetic attention. The comparisons made by us during our travels, are for the most part contained in Vol. 5. of our manuscript volumes.

together, in order to secure for them an equal temperature, so that reduction to zero became unnecessary.¹

1855, Jan. 4, Púna.			1855, Jan. 6, Sásur.		1855, Febr. 3, Koghíra.

2. HERMANN: CALCUTTA, 1855, APRIL, TO SÍMLA, 1856, MAY, INCLUDING SÍKKIM AND ASSÁM.

Barom. 1, Greiner. During the present journey, I used this barometer almost exclusively, as it always remained in good order. Upon my return, I was fortunate enough to be able to compare my instrument with one belonging to the late Dr. Tritton of Ambála, a standard barometer by Newman with very large tube (diameter 0·55 inch) and cistern, and in perfect condition.

Tritton's Newman.	Barom. 1, Greiner.
28·796 inches = 731·40 millim.	731·29 millim. = 28·791 inches.

Resulting correction for barometer 1, Greiner, + 0·11 millimetre.

Barom. 5, Adie. This barometer, after being re-filled in the Surveyor General's Office at Calcutta, kept the same correction as it had in London, viz. — 0·3 millimetre.

We found:

1855, March 23, at Calcutta.		1855, April 16, Pankabári, in the Sikkim Taráí.	
Troughton's Standard in the		Barom. 1, Greiner . . .	711·6 millim.
Surveyor General's Office .	760·0 millim.	Corr.	+ 0·1 „
Barom. 5, Adie	759·6 „	Barom. 1, corrected . . .	<u>711·7</u> „
Corr. for barom. 5, Adie . .	+ 0·4 „	Barom. 5, Adie	<u>711·5</u> „
		Corr. for barom. 5 . . .	+ 0·2 „

Mean of the correction for barom. 5, Adie = + 0·3 millimetre.

Barom. 14, Newman, was only occasionally used. See general remarks, p. 13.

¹ In the comparisons with the thermo-barometers, as well as in the tables of barometric measurements, the readings of the barometers are of course reduced to 32° Fahr. and corrected for instrumental errors, capillarity, &c. The tables we used for the reduction of the barometrical column to 32° Fahr. are referred to a dilatation in volume of 0·000180180 for 1° C., as ascertained by Dulong and Petit. This is also the value adopted by the Committee of Physics and Meteorology of the Royal Society. Regnault (mém. de l'institut XXI., p. 318) found 0·00018153; Miltzer (Pogg. Annal. LXXX., p. 84) 0·00017405.

² The correction of *scale* for these instruments is already applied. See p. 12.

3. ADOLPHE AND ROBERT: 1855, MARCH, TO 1856, MAY. NAINITÁL TO MÁSSÚRI.
AND SOUTHERN INDIA TO SÍMLA.

We had:

Barom.	2, Pistor.	4, Adie.	6, Adie.
Corr. (millim.)	— 0·1	+ 0·6	+ 1·0

Barom. 2, Pistor. This remained in perfect order and kept its correction — 0·1 till 1855, Sept. 30, when an air bubble made its appearance, and it was no longer used.

Barom. 4, Adie. This barometer remained unaltered till 1855, June 8, when it got out of order. It was repaired at Déra, but the correction was found to be unchanged. A few months later it began to leak so much, that I (Robert) was obliged to empty it, 1856, January 10, when I continued my observations, as far as Símila, with thermo-barometer 8, Geissler. The instrument was then repaired again at Déra, and used from April, 1856, till June 18, 1856.

Barom. 6, Adie. This had been filled again March, 1855, at Calcutta, where, from comparisons made with barom. 1, Greiner, by Hermann, before sending it to us, the correction was found to be + 1·0 millim. The list of the comparisons here communicated shows that its correction remained unaltered nearly till April, 1856. On the way from Bangalúr to Madras, March 18 to 21, 1856, Adolphe was obliged to take it with him into the dak carriage, where, though stowed away with the utmost care, it became disordered from the effects of the violent shaking. It was filled a second time at Calcutta, April, 1856, and kept the same correction,¹ as will be seen from the comparisons made after leaving Símila.

DETAIL OF COMPARISONS.

1855, March 23, Calcutta.		1855, April 12, Fatigárh.	
Barom. 4, Adie.	6, Adie.	Barom. 2, Pistor.	6, Adie.
Millim. 759·3	759 0	Millim. 749 5	748 4
Corr. + 0 6	+ 1·0	Corr. — 0 1	+ 1 0
759 9	760 0	749·4	749 4

¹ In this instance, as well as in many others, we repeatedly found that barometers, after being boiled out a second time and properly re-filled, showed the same correction as before. This, indeed, is no more than might have been expected, for, when the scale, zero point, and cistern remain unaltered, and the same glass tube is filled with pure, properly boiled mercury (of the same specific gravity), there is every probability of the correction remaining unchanged.

1855, April 18 to 26, Nainital.

Our guide Eleazar had, from Calcutta up to Nainital, barometer, 13, Newman, which got out of order, 1855, May. The correction of this instrument for low heights, determined in the Surveyor General's Office by comparison with the Calcutta standard, was + 0·021 inch.

¹ Mean of 28 comparisons with barom. 2, Pistor.² Mean of 22 comparisons with barom. 2, Pistor.

4. HERMANN, ADOLPHE, AND ROBERT. 1856, MAY TO THE END OF THE JOURNEYS.

CORRECTIONS OF THE BAROMETERS USED.

Barometers: 1, Greiner.	4, Adie.	5, Adie.	6, Adie.	7, Pistor.
Corr. (millim.) + 0·1	+ 0·9	+ 1·6	+ 1·3	+ 1·3
Barometers: 8, Pistor.	9, Pistor.	10, Pistor.	11, Pistor.	
Corr. (millim.) + 0·6	+ 0·7	+ 0·6	+ 0·5	

Barom. 1, Greiner. This was Hermann's barometer, and kept in perfect order from 1854, September, till 1856, August 3. We were obliged, on account of the great height, exceeding 20,000 feet on the Säßer peak, to take a considerable quantity of mercury out of the shorter branch of the syphon. Upon inverting the barometer, a large air bubble introduced itself, and from this time the instrument was useless.

Barom. 4, Adie. This instrument, after being out of order from 1856, January 10, was sent to the Surveyor General's Field Office at Déra. A new glass tube being put in, and the zero-point altered by replacing the original edge with another, its correction no longer remained the same as before. In Simla, where it was generally kept stationary, it continued in perfect order, but when we were travelling it began to leak, and had to be given up June 18, 1856.

Barom. 5, Adie. This was filled again in Calcutta after my (Hermann's) return from Assám. A new zero point being made, the correction changed to + 1·6 millim.

Barom. 6, Adie. Adolphe's chief barometer, which he must have had with him at Káshgar, up to the very last period of his journeys. Though the correction was a large one, it always remained without alteration.

Barom. 7, Pistor. Chiefly used by Robert as far as Ceylon, where it was broken on the 29th of April, 1857, through the carelessness of a kúli.

Barom. 8, Pistor. Got out of order 1857, February 2, and was then used no longer.

Barom. 9, Pistor. *Brought back to Europe without accident*, and found to be in good condition when last compared with the standard of the Berlin Observatory. Hermann used it as his standard barometer from 1856, December.

Barom. 10, Pistor. This instrument was occasionally used by Hermann for com-

parison, and was generally kept as a spare instrument in case of accident to the other barometers.

Barom. 11, Pistor. Used by Adolphe from Pesháur to Sultánpur; it was then handed over to Hárkishen, when he separated from Adolphe, 1857, May 31. Hárkishen took observations with this instrument till Dec., 1857; we have now received it in a dilapidated condition.

¹ Standard barometers. See p. 12. ² These instruments have also a correction of scale. See p. 12.

II. THERMO-BAROMETERS, OR BOILING-POINT THERMOMETERS.

Besides barometers, we had with us several thermo-barometers, or boiling-point thermometers,¹ which were constructed with much greater nicety than the ordinary thermometers, and answered their purpose exceedingly well.² When travelling in disguise, and under the necessity of concealing our instruments, we were obliged to leave our barometers behind, and to limit ourselves entirely to the use of thermo-barometers. Travellers placed in circumstances of similar difficulty will, we think, find these instruments preferable to barometers, as they are more portable, can be carried with greater ease and safety, and are much less liable to get out of order. Great accuracy, moreover, is attainable with them in the determination of heights, and their general advantages, which we can speak to from experience, are such as to induce us to give a detailed description of their construction and use.

a. *Description of the thermo-barometers.* Our thermo-barometers were made at Berlin, by Geissler, and by Greiner. They have a length of 1 foot 9 inches, and range from 100° C. down to 78° C., so that they can be used from the sea-level to a height of about 22,600 feet. Although the range of their division did not generally allow of their being used at the same time as ordinary thermometers, yet we were able to employ them occasionally for the exact determination of the temperature of hot springs, and for experiments on insolation.

The scale does not consist of brass, but of milk glass, half an inch in width, which is placed inside a cylindrical glass tube. The great length of the instrument admits of each degree being divided into 50 parts, which are yet perfectly clear and distinct to the eye, and with a magnifying glass even tenths of these fiftieths may be easily and correctly read off.

¹ Le Monier, a physician, who made his observations in Perpignan, in the year 1739, was probably the first who used thermometers for the purpose of ascertaining heights. In India, Mr. Prinsep, Lieutenant Robinson, and Colonel Sykes, were among the very first who made comparative observations of the boiling-point at different heights. See Colonel Sykes' Memoir in the 8th Vol. of the London Geographical Society, and J. Burgess, Esq., in Journal As. Soc. Bengál, Vol. XXVII.

² On the continent, these instruments are occasionally called *hypsometers*, a term which we also adopted in our researches on the Alps, and in the first volume of the present work. But we have now thought it better to use the name thermo-barometer, as one giving a better definition of the construction and purpose of the instrument.

The thin tube, up which the mercury passes, enlarges at its lower extremity into a cylindrical reservoir. The bulb is of an elongated cylindrical form, $1\frac{1}{2}$ inch long and $\frac{3}{4}$ inch in diameter. A cap, or perforated cylinder of brass, 3 inches in length, is screwed to the lower end of a brass collar ($1\frac{1}{2}$ inch long) which, fastened to the tube about an inch above the bulb, and connected with a surrounding mantle, serves to keep the thermo-barometer in a vertical position, when placed in the boiling apparatus. This cap also protects the bulb from being affected by the presence of any foreign matter accidentally introduced into the water, and which, if slightly overheated by contact with the sides or bottom of the vessel, would be the occasion of errors.

The bulb stands, not in the water, but in the upper part of the boiling apparatus, which is filled with steam only, and cannot become overheated, on account of the vapour having a free escape at the upper end.

When the water is boiling, the steam passes off through the interstice between the collar and surrounding mantle into a cylindrical brass tube placed at the top of the collar. This tube is very important; it encloses the glass scale, and, heated as it is by the steam, possesses the great advantage of screening the column of mercury from the lowering influence of the external atmosphere. It is composed of several pieces, moveable like the slides of a telescope, so that the observer, who knows beforehand the approximate height of the boiling point, is able to regulate the length accordingly. The steam finally escapes through a lateral aperture at the upper end of the tube, the top of which is covered by a flat piece of caoutchouc to prevent the condensation of vapour on the upper parts of the cylinder, where the scale is to be read.

The boiling vessel, which is filled with water to a depth of about 3 inches, consists of a cylinder, $6\frac{1}{2}$ inches by $2\frac{1}{4}$. The upper part of the sides is perforated with several holes, through which the steam passes into an outer cylinder of the same length, but of a larger diameter. This mantle, which, as far as we know, is very rarely, if ever, made use of, serves to prevent the cooling of the apparatus by contact with the outer air, and if not applied, it is occasionally impossible—as in a strong wind—to obtain a steady reading.

The boiling vessel, provided with three legs, which are made to unscrew, for convenience of packing, may be placed either over charcoal, or over an ordinary spirit lamp.

The method we adopted was to place it over a small vessel filled with charcoal, of which a comparatively small supply would last for a considerable time. This vessel—a square iron trough, with sides 3 to 4 inches long, and 4 inches deep—was 1½ pound in weight, and was firmly connected with the boiling apparatus, for which it formed a good support, by a bayonet joint. Through two small holes, perforated in the sides, the lighted charcoal could be kept alive by means of a bellows, or by blowing upon it with the mouth.¹

With such an apparatus the observer is always sure to succeed in making the water boil properly. Spirit lamps we never employed, the use of them being attended with many disadvantages. Not only is it a serious additional encumbrance to carry about a sufficient supply of spirits of wine, but sometimes it is exceedingly difficult to get the water to boil at all. It may even happen, that an observer may consider his experiment as concluded, when he sees the thermometer no longer rising, even though the mercury may not yet have reached the boiling-point. Such a case may easily take place during strong winds, when more precaution than usual must be observed.

In the plains of India we used distilled water only for boiling, of which we always had a large supply with us; in High Asia we occasionally had recourse to melted snow. Before making an observation, the boiling apparatus was carefully cleaned out.

An overheating of the steam was not to be feared, the fire lighted being very small in comparison with the water to be converted into vapour. Solution of salt in the water employed—ordinary spring, or river water, for instance—would not, it is true, directly affect the temperature of the steam developed; but in consequence of the comparative proximity of the vessel of the thermo-barometer to the surface of the boiling water, radiation could not be sufficiently excluded, and might perhaps, though to a very small extent, erroneously affect the temperature.

b. *List of the thermo-barometers.* Upon our departure from England, in 1854, we had with us eight thermo-barometers of this fine and delicate construction. Two of them were broken on the overland journey, and two others got out of order on

¹ We may here mention, that the natives engaged by us, and more especially those of Sikkim, employed for this purpose a kind of cylinder. This tube, which was generally a bamboo cane, they held at some distance from the mouth, applying it with considerable dexterity.

our way from Bombay to Madras, so that, during our travels, we could only make use of three of the instruments, marked respectively: 5, Greiner, 7, Geissler, and 8, Geissler; and with these three the greater part of our thermo-barometric observations were taken. Seeing the good results obtainable by thermo-barometers, we subsequently used two of our best thermometers as thermo-barometers.

In India we received, through the kindness of our friends, several additional thermometers, which, however, were of a somewhat less delicate construction than those already mentioned.

The following table contains the list of the thermo-barometers used, with their scale division and the name of the maker. The asterisk distinguishes those with the more delicate construction as detailed above.

No.	Maker's Name, and No.	Scale.	No.	Maker's Name, and No.	Scale.
1*	Greiner 23	French Lines	5*	Geissler 5	Centigrade
2*	Greiner 132	Centigrade	6	Geissler 20	Centigrade
3	Unknown	Fahrenheit	7*	Geissler 7	Centigrade
4	Geissler	Centigrade	8*	Geissler 8	Centigrade

Thermo-barom. 1, *by Greiner of Munich, was given to us at Calcutta, March, 1856, by Baron George Liebig, and had already been used by him in taking observations. It was employed by our assistants, Mr. Monteiro and Eleazar, from June to September, 1856, when they marched from Simla, through Kangra and Jammu, to Kashmir.

Thermo-barom. 2, Greiner. A spare instrument, but occasionally used during our travels in Turkistán. Each degree was divided into 50 parts.

Thermo-barom. 3. We were furnished with this instrument by Professor Halleur at Calcutta, in March, 1856. Some comparisons, however, showed that this thermo-barometer, which was divided into half degrees of Fahrenheit, was affected with great irregularities, so that we never made any use of it.

Thermo-barom. 4, Geissler, an ordinary, but very good, thermometer, divided into tenths of a degree, was used and made over to Lieutenant Adams, who kept it as a spare instrument in case of an accident happening to thermo-barometer 6.

Thermo-barom. 5, Geissler. With this instrument we made nearly all our determinations of heights in Turkistán. Each degree was divided into 50 parts. It was generally with Hermann.

Thermo-barom. 6, Geissler. Originally an ordinary thermometer, which, on account of its accurate division and small error, was very successfully used by Lieutenant Adams during his travels in Assám and along the river Bóri Dihíng. The instrument was divided into tenths of a centigrade degree, and, with a magnifier, could be read off in fiftieths with sufficient accuracy.

Thermo-barom. 7, Geissler, and 8, Geissler. No. 7 was generally with Adolphe, No. 8 with Robert. The greater part of the heights in Gnári Khórsum, and some also in Málva, have been determined by them. Subsequently the columns of mercury parted, and all efforts to unite the divided threads proving unsuccessful, the instruments were given up as useless.

c. Determination of the corrections of the thermo-barometers by comparison with barometers.

The corrections were ascertained in the usual way for those two of our instruments which had originally been ordinary thermometers, viz., Nos. 4 and 6. Their error at freezing point (0° C. — 32° Fahr.) was determined by placing them in pulverized ice; for higher temperatures, by comparison with standard thermometers; and for corrections near boiling-point, recourse was had to simultaneous readings of the barometer. The error for each degree of the scale was then found, either by interpolation, or by simple construction of curves.

The definitive determination of the errors of the delicate thermo-barometers, as Nos. 1, 2, 5, 7, and 8, presented much greater difficulties, if due allowance was to be made for the full value of their scale divisions. Such inquiries could be followed out with two distinct objects in view, the one practical, the other theoretical, and each independent of the other.

For practical purposes, the most direct way of operating was to procure numerous direct comparisons of the thermo-barometers with a barometer at different heights. Such series, if sufficiently detailed, served to eliminate the error of the scale division, and even made us independent of any slight error, which might possibly exist in the numeric tables generally used for converting the boiling-point into the corresponding pressure of the atmosphere.

The two following elements of disturbance, may, however, interfere with the limits of the nicest accuracy in such observations:

- a. An alteration in the size of the bulb by gradual contraction, or expansion.
- b. A temporary, or permanent alteration in the size of the bulb, from long exposure to atmospheres of different pressure.

In our instruments neither of these causes of error were appreciable. Although, after our arrival in India, repeated determinations of the boiling-point at low elevations were made at different places, both at the commencement and middle of our journeys, as also at the station near the level of the sea, which we reached on our return from the interior, yet we were never able to detect any appreciable increase of the corrections, a result which would certainly have followed from a contraction of the bulb with time.¹

With respect to this regularity of their action, something is due to the fact of the instruments having left the maker's hands some months previous to our departure from England. A comparison of the corrections determined at Kew with those ascertained by ourselves a few days after our arrival in India showed a very slight expansion to have taken place. It was of no importance, however, in itself, and did not undergo any subsequent increase.

The thickness of the glass used in the construction of the instruments proved very useful, and entirely excluded temporary expansion of the bulb at great heights. My brothers noticed variations of this character in their thermo-barometers on Monte Rosa,² and afterwards proved by direct experiments with the air pump, that the lessening of the atmospheric pressure has the immediate effect of somewhat expanding the bulb, when the glass is too thin. The observed boiling-point is thus lowered; but if the glass is made thicker, this disadvantage may be obviated. The thermo-barometer, by this modification, is certainly rendered a little less sensitive, though in an experiment where the instrument, from its general dimensions, must remain in

¹ Flaugergues was the first who drew attention to this interesting fact. The amount of the contraction, in extreme cases, exceeds 1° C. See "Bibliothèque universelle de Genève, 1823." Mr. d'Abbadie has proved, that even Person's method of boiling the instruments in a solution of nitrate of potash previous to taking observations is not sufficient for the due, regular expansion of the bulb to its normal limits. See "Cosmos" 15th livraison, October 12, 1860.

² Neue Untersuchungen. Leipzig 1851, p. 276

steam for a considerable time, such an alteration is a matter of absolutely no importance.

In the following tables we give the full detail of our numerous comparisons, of which several have been made at heights exceeding 18,500 feet; in them we include only those delicate instruments that were originally constructed as thermo-barometers (Nos. 1, 2, 5, 7, and 8 of the list p. 25). The simultaneous barometer readings, completely corrected (for temperature, scale error, capillarity, &c.), are reduced to corresponding boiling-points according to Regnault's revised tables¹; and, as our *fundamental* determinations, given p. 33—35, will show, these tables may be considered as in perfect accordance with the results of absolute comparisons. We therefore obtain, as their immediate result, the instrumental errors of the several thermo-barometers.

Mr. Wisse, who also took simultaneous observations of the temperature of the boiling-point of water and the height of the barometer, had 430 millimetres = 16·929 inches as lowest barometric pressure at the summit of the volcano of Pichína.² Dr. Hooker, who during his travels also made thermo-barometric observations, found his lowest boiling-point at the Dónkia mountain to be 179·9 Fahr. = 15·234 inches.³ His instruments were not, however, of a construction to furnish data for ascertaining the correctness, or otherwise, of the thermo-barometric tables hitherto in use.

The greatest height at which we compared thermo-barometers with barometers, as will be seen by the following tables, was at Íbi Gámin camp, 19,323 feet above the level of the sea, where the barometric pressure was 375·6 millimetres = 14·788 inches (see p. 31).

¹ Regnault's tables, revised by A. Moritz, in the *Journal de l'Institut*, 1856. These tables are given in detail in part I., No. VI., of this Vol.

△ Loaka	15,831	1855, July 7	Adolphe	84.76	6, Adie	425.8	84.58	— 0.18

From the mean correction of each of these three groups we obtain the following corrections for the different boiling-points:

100 to 96 — 0.12	93.99 to 92 — 0.15
95.99 to 94 — 0.13	91.99 to 90 — 0.16
91.99 to 92 — 0.14	89.99 to 88 — 0.17
87.99 to 81 — 0.18.	

d. *Fundamental determination of the corrections.* For fundamental determinations, made for the purpose of testing the limits of accuracy in the tables for reducing boiling-points into barometric pressure, it was necessary to ascertain:

- a. the correction of the thermo-barometers at 760 millimetres pressure, and
- b. the gradual change of this correction for various points of the scale.

Such differences exist in nearly every thermometer.

In the construction of our thermo-barometers, where the scale does not commence before from 78° to 82° C., the maker can consider the boiling-point alone as defined, whilst in ordinary thermometers the freezing point also offers a limit of the scale equally well defined.

From the records of the Kew Observatory, which the officers of that establishment with their usual kindness communicated to us (see p. 15), we obtain, for thermo-barometers 7 and 8, in September, 1854:

1.	The correction at 100° C. =	$\left\{ \begin{array}{l} - 0.07 \text{ C. for thermo-barom. 7.} \\ - 0.15 \text{ C. " " 8.} \end{array} \right.$
2.	" " " 82° C. =	$- 0.25 \text{ C. " " 7.}$
	" " " 83° C. =	$- 0.20 \text{ C. " " 8.}$

A careful examination of the calibre of the capillary tube showed, that there was no appreciable deviation from the gradual alteration of these corrections to be proportional to the readings.

At Bombay, in Dec., 1854, we found the correction at $100^{\circ} \cdot 26$ Centigrade

for thermo-barom. 7 — 0.05
for thermo-barom. 8 — 0.12

the bulb having, it seems, somewhat expanded from the effects of successive shocks (see p. 27).

In order to be more independent of accidental modifications connected with the several instruments and their observations, we take, in the following readings, the mean of 7 and 8. The corrections for these mean readings are based on the Kew observations, whilst, at the same time, the alteration observed near the boiling-point at Bombay is considered a constant difference for the entire scale.

The corrections become:

Temperature. Centigrade.	Mean Corr. for Thermo-barom. 7 and 8. Centigrade.
100·25	— 0·09
95·25	— 0·13
90·25	— 0·16
85·25	— 0·20
82·25	— 0·22

As the thermo-barometrical tables in use agree for a pressure of 760 millimetres,¹ and differ very little in its neighbourhood, we select from the lists pp. 31 and 32 those observations where the two thermo-barometers have been read simultaneously at very great heights, and compare the barometric pressure directly observed with the results of Regnault's tables, as revised by Moritz, and also with those of Magnus.²

ABSOLUTE COMPARISON OF THE BAROMETER WITH THERMO-BAROMETERS.

Place of Observation.	Year, and Date.	Height.	Thermo-bar. Readings. Centig.			Mean Cor- rection for Thermo- barom. 7 and 8.	Thermo- barom. Mean corrected. Centi- grade.	Barometer.	
			Thermo- barom. 7.	Thermo- barom. 8.	Mean			Simul- taneous barom. Readings.	No.
Mána	1855, Aug. 28	Feet. 10,308	89·85	89·87	89·86	— 0·17	89·69	519·1	6, Adie
Δ Laptél	1855, July 11	13,991	86·70	86·69	86·695	— 0·19	86·50	459·6	6, „
Δ Loňka	1855, July 7	15,831	81·72	81·76	81·74	— 0·21	81·53	425·8	6, „

¹ Their agreement near the boiling-point is the natural consequence of the experiments on which they are based.

² The well known and careful researches of Magnus are contained in "Poggendorff's Annalen der Physik und Chemie". Vol. 61, pp. 225 - 247; 1844. As the general table only gives the values for every full degree of Centigrade, the numbers given p. 35 are calculated from Magnus' formulæ:

$$e = 4 \cdot 525 + 10 \frac{7 \cdot 4475 t}{234 \cdot 69 + t}$$

where t is the observed temperature of the boiling-point.

Comparison of *observed* Boiling-points with *calculated* Tables.

Place of Observation.	Observed Boiling-Point, corrected for instrumental Error. Centigrade.	Simultaneous barom. Readings reduced to 0° C., and corrected for instr. Error.	Observed Boiling-Points, reduced to Millimetres, from the Tables of	
			Regnault, revised by Moritz.	Magnus.
Mána	89.69	519.1	519.2	518.6
△ Laptél	86.50	459.6	459.2	458.5
△ Loáka	84.53	425.8	425.1	424.4

The accordance could not be closer, particularly with Regnault's tables, whilst the values of Magnus appear to be a little too low for great heights. The determinations of the latter, however, must be considered as remarkably correct, when it is remembered that, at these heights, an alteration of the boiling-point of 0.05 C. only produces a difference of 1.1 millimetres.

III. ANEROIDS.

There has been much discussion in reference to the utility of aneroids, which, if sufficient reliance could be placed upon them, would certainly be the most convenient instruments for determining heights. Some detailed series of observations and ingenious experiments, made in India by scientific gentlemen,¹ have clearly demonstrated, that aneroids, when kept stationary at one place, and not exposed to great changes of temperature, indicate the variations of the atmospheric pressure with a considerable degree of correctness.

They can also be used with advantage, if previously compared with barometers, up to heights of about 5,000 feet. The results of our own experience seem so far to corroborate the observations of our predecessors; we have, however, found that, without the aid of very frequent simultaneous comparisons with barometers, aneroids can never be used with any degree of accuracy for the determination of heights, or of atmospheric pressure. If compared with barometers, they may be successfully employed as instruments for interpolation, when the relative height does not exceed 4,000 feet. We have repeatedly had occasion to observe that, at heights of more

¹ Dr. G. Buist, on the adaptation of the aneroid for the purposes of surveying in India. *Journal of the Asiatic Society of Bengal*, 1851. In this elaborate memoir, the late Dr. Buist has included the observations of Major Thuillier and Professor Patton.

than 15,000 feet, the vacuum cylinder, or metallic chamber, of the aneroid requires a considerable time to indicate, with some approximation, the low pressure of the upper station. The same slowness of adjustment occurs again in a rapid descent from the height.¹ Therefore, the instrument can be but very cautiously used for the determination even of small differences of height.

The fact of a barometer being out of order is easily established; to ascertain the correctness of a thermo-barometer is also a matter of no difficulty; but, from the peculiarity of the construction of the aneroid, it is impossible to detect at once any incipient derangement in its parts, or to ascertain the exact amount of error produced by it. Even when most carefully packed (our aneroids were placed in large bags, thickly stuffed with cotton, and carried by men), they are greatly affected by the slight shocks which it is too often impossible to avoid when travelling over bad roads, or in mountainous districts. For the determination of heights, thermo-barometers, even of an inferior construction, are decidedly to be preferred to aneroids.

We had in all nine aneroids with us, three made by Oertling of Berlin, five by Imme of Berlin, one by Hohnbaum of Hanover. Those of Oertling, which had a circular opening in the dial plate, so as to allow of a minute inspection of its machinery, were extremely liable to get out of order, and a sudden increase of temperature, or even a slight shock, seriously affected the action of the lever. Imme's aneroids, as well as that of Hohnbaum, were very carefully and solidly constructed, and sustained much better the unavoidable casualties of travelling.

The division of our aneroids was in millimetres,² ranging from 780 to 350, so as to admit of their being used even at heights exceeding 22,000 feet. Being able, in all our journeys, to take with us either a barometer, or thermo-barometer, we were under no necessity of using aneroids for the determination of heights, and accordingly employed them only for the measurement of small relative heights, also for calculating the amount of erosion, and thickness of geological strata, and occasionally for determining the limit of trees, and other less strictly defined objects.

¹ A detailed discussion on aneroids, based upon several experiments at great heights of the Alps, is contained in the "Neue Untersuchungen über die physikalische Geographie der Alpen", von Hermann und Adolph Schlagintweit, Leipzig, 1854, p. 428, where also an attempt is made to explain the influence of time on the gradual accommodation of the aneroid to the pressure at various heights.

² We had also the boiling-points, corresponding to the millimetres, engraved on the dial plate, an arrangement possessing the additional advantage, that it allows of the aneroid being checked by comparison with the thermo-barometer. See note on its use for rough estimations, p. 78.

IV. THERMOMETERS.

The thermometers (dry and wet bulb) that we used for the determination of the temperature of the air had Centigrade scales, and were made by Geissler, and Greiner, both of Berlin, and by Greiner of Munich. We had also two standard thermometers by Newman of London. The division, in tenths of a degree, was in some instruments made upon milk glass, in others upon paper, and each of the scales was enclosed in a glass tube.

These tubes not only have the advantage of protecting the scale from dust and moisture; but in those instances more particularly where wet bulb thermometers are used, or the temperature of the ground, water, &c., is to be taken, they modify, in a very marked degree, the discrepancies arising from the inequality of the thermic conditions between the bulb and the capillary tube. Glass scales we think preferable to the metal ones of English construction; they are less liable to be affected by changes of temperature, and their connection with the capillary tube is made permanent by the glass cylinder surrounding them. The two standard thermometers of Newman had a division on the glass itself. This arrangement serves all the requirements of the extremest accuracy in the institution of comparisons, but is defective when the bulb and stem are not in equal conditions of temperature.

To make the thermometers as portable as possible, the scales of many of them were limited to a short range, some extending from -10° C. to 40° C., one to 60° C., and a few only up to 100° C. Some of the latter were, as already stated, also used as thermo-barometers (see p. 25).

Before our departure, the corrections of all thermometers were most carefully recorded for different temperatures at the Kew Observatory, and while in India we repeatedly ascertained the amount of error, either by determinations of the zero point in ice,¹ or by comparisons with the standard thermometers at the Observatories of Bombay, Madras, and Calcutta.

In general the thermometers kept their original correction, the amount of which may be stated on a fair average, as $-0^{\circ}\cdot2$ C.; a few, however, showed corrections

¹ Ice is now brought in large quantities to the seaports of India, being sent round the Cape, from America, and more particularly from the Wenham lake. In some parts of the interior it is artificially procured during the cool season, by exposing water in flat vessels to the refrigerating effects of nocturnal radiation.

as large as $-0^{\circ}\cdot5$ C., and even $-0^{\circ}\cdot6$ C. In the case of two instruments only the correction was positive.

We took with us to India, for ourselves and our establishments, upwards of sixty thermometers (each marked with a number), of which, however, scarcely more than six or eight have been brought back in a serviceable state. Some of them were lost at Káshgar, together with other instruments and effects belonging to Adolphe; several, from constant use, and the wear and tear incidental to travelling, were rendered useless by the separation of the mercury column; while others, in spite of our utmost precautions to ensure their safety by careful package in metal cylinders placed in cotton bags, got broken, either through unavoidable accident, or by the operation of natural causes.

Four thermometers were smashed to pieces during the remarkable hail-storm, 1855, May 11, 5^h to 6^h 30^m p.m., which came upon us unexpectedly when we were at Nainítál;¹ four were lost, 1855, July 15, at Δ Laptél, a halting place, 13,994 feet above the level of the sea. The day was unusually hot, and the kúli who carried the instruments had put them on the ground, the surface of which, as we afterwards found, was at a temperature of nearly 50° C. = 122° Fahr. The thermometers having a scale of 40° C. only, their bulbs were cracked by the expansion of the mercury.²

¹ A detailed account of this hail-storm will be given in the meteorological part of our publications.

² Our experience leads us to suggest, as extremely useful for the purposes of the scientific traveller, that the thermometers should all be provided with scales ranging from freezing to boiling-point. This completeness of range not only renders them available in extraordinary instances, as extreme insolation of the ground, hot springs, &c., but, while allowing of more accuracy in the determination of corrections, dispenses in a degree with the necessity of comparison *in loco* with standards.

If short ranges are used, as may be sometimes desirable when very minute divisions are required, the instruments should, at all events, have an enlargement in the upper part of the tubes, as a provision for the expanded mercury.

II. CORRESPONDING METEOROLOGICAL STATIONS.

- A.* Geographical co-ordinates of the corresponding stations.
- B.* Instruments and hours of observation, at the stations. 1. Bombay 2. Madras 3. Calcutta. 4. Gohatti.
5. Darjiling. 6. Pátna. 7. Ágra. 8. Aligárh. 9. Ambála. 10. Peshawar 11. Massúrah. 12. Banog Hill.
13. Simla. 14. Leh.
- C.* Secondary corresponding stations.
- D.* Selection of the corresponding stations.

In addition to the registers kept by the Government Observatories of Bombay, Madras, and Calcutta, we are indebted to the scientific zeal of several gentlemen, whom we had the pleasure of meeting during our travels in India, for a large number of observations corresponding to those taken by ourselves.

These observations, it is hardly necessary to add, have formed a most valuable basis for the calculation of our heights, as they enabled us to connect every point of our observations with the sea shore, or with inland stations of known elevation. At comparatively few places only observations had to be interpolated, and this when our hours of observation did not exactly coincide with those of the corresponding stations.

The following table contains the geographical co-ordinates of our corresponding stations, and is succeeded by a description of each station, together with a few general remarks.

A. GEOGRAPHICAL CO-ORDINATES OF THE CORRESPONDING STATIONS,
USED FOR THE CALCULATION OF BAROMETRIC HEIGHTS.

B. INSTRUMENTS AND HOURS OF OBSERVATION.

1. *Bombay.* The hourly observations, magnetic and meteorological, taken at the Government Observatory (now under the superintendence of Lieutenant E. F. T. Fergusson), are published in Bombay for each year under the title: "Magnetic and Meteorological Observations, made at the Observatory, Bombay." Each volume contains a detailed description of the instruments used.

2. *Madras.* The observations taken at the Government Observatory have been kindly communicated to us in manuscript by the Government Astronomers, Major Jacob and Major Worcester.

¹ We had no occasion to use, as corresponding station, Baréli, where a series of careful observations were taken by Dr. Arthur Payne, from June to September, 1855. They will be discussed in detail in the Vols. of Meteorology.

3. *Calcutta*. Hourly registers of meteorological observations are taken at the Surveyor General's Office, and an abstract of the results is regularly published in the Journal of the Asiatic Society of Bengal. We owe a copy of the hourly observations to the kindness of Colonel Waugh and Major Thuillier.

4. *Gohátti*. The careful observations taken by Dr. Simons with a barometer by Troughton (diameter, 0·5 inch) were copied, with the observer's permission, by Lieutenant Adams. Dr. Simons' hours of observation were: sunrise, 10^h A.M., 4^h P.M., and 10^h P.M. The height of his barometer was 134 feet. A direct measurement showed it to stand 64 feet (19·5 metres) above the Brahmapútra, which is here 70 feet higher than the mean sea level. This value was deduced by calculation of the fall of the Brahmapútra, assuming for Sádía a height of 210 feet. Lieutenant Wilcox gives 130 feet as that of the *station* of Gohátti.

5. *Darjiling*. Dr. J. R. Withecombe, the Civil Assistant Surgeon of this sanitarium, has, for a number of years past, made a series of careful meteorological observations, at the so-called Observatory Hill. His barometer is by Barrow & Co., marked No. 18, and, as compared with Colonel Waugh's standard at Calcutta, had a correction of + 0·015 inch. Hermann, when comparing it in May, 1855, with his standard, 1 Greiner, found the correction to have remained unaltered. The thermometers are by Newman.

During Hermann's travels in Sikkim, Dr. Withecombe most obligingly placed the registers of his observations at the former's disposal. The hours of observation were 6^h and 9^h A.M., and 3^h and 9^h P.M. The height of Observatory Hill, 7,168 feet, has been determined by the Great Trigonometrical Survey.

6. *Pátna*. The observations at this station owe their origin to the scientific zeal of Mr. Knott, Deputy Collector. His barometer, by Newman, had a diameter of 0·01 inch, and its correction was found by comparison with one of Hermann's barometers (9, Pistor) to be + 0·067 inch.

The height of the barometer, 170 feet above the level of the sea, was calculated from Calcutta. The details are given later, in Area II.

7. *Ágra*. These observations were taken at the Office of the Secretary to the Government of the North West Provinces. We are indebted for a copy of them to Messrs. Muir and Thornhill. The hours of observation were:

6 ^h A.M.	12 ^h Noon
9 ^h A.M.	4 ^h P.M.
10 ^h A.M.	9 ^h P.M.,

though there are occasional omissions for 6^h A.M., and 9^h P.M. An abstract is published monthly in the Journal of the Asiatic Society of Bengál.

The barometer used was by Newman, marked No. 124; diameter of tube 0·562 inch. There was no appreciable correction, and it had a capillary depression of 0·005 inch. The height of the barometer at this station we have determined from simultaneous observations taken at Ágra and at the Tower Station of the G. T. S. near Ferozabád, about 26 miles E.S.E. of Ágra. The following exact description of this tower station, the top of which (trigonometrically determined) is 690 feet above the level of the sea, was communicated to us by Colonel Waugh, when we had the pleasure of seeing him at Mässúri, in October, 1855.

"Tower Station near Ferozabád.	Latitude North	27° 8' 34"
	Long. East Green.	78 22 41

"This station is at the south-east corner of an old mud fort, situated about a quarter of a mile west of Ferozabád, in Thasíl Ferozabád, and Zilláh Ágra. The station mark is a foot below the terre-plein of the rampart, and is surmounted by a tower 43 feet 10 inches high and about 14 feet square; at top similar in the materials and detail of construction to the tower at Íterpur station."

My instruments (Robert) were placed at the foot of the tower, and consequently at a height of 646 feet (top of tower 690 feet--44 feet height of tower).

The barometer at Ágra was found to be 11 feet higher than Ferozabád; therefore, height of Ágra — 657 feet. The detail of the observations is given later. The circumstance of both stations belonging to exactly the same type of climate, and also of the longitudinal difference amounting to a few minutes only,¹ may be especially adduced in favour of this determination.

8. *Aligárh.* We have received the careful corresponding observations, taken from April, 1855, to July, 1856, by Mr. Charles Gubbins. The correction of his Newman's barometer, which had been filled at Rúrki, in Jan., 1855, was found by comparison with Hermann's Greiner to be -|- 0·096 inch. The hours of observations were 6^h and 10^h A.M., and 4^h and 9^h P.M. The height of Aligárh, 750 feet, is the value, deduced from two months' corresponding observations at Ágra.

¹ See notes on the influence of longitude, p. 45.

9. *Ambála*. Hermann had been favoured with a valuable series of observations, taken from June, 1851, to July, 1856, by the late Dr. Tritton. This gentleman had an excellent barometer by Newman of 0·55 inch diameter (marked No. 102), which we had occasion to compare with one of our own barometers;¹ his thermometers were by Barrow, and had a correction of — 0°·9 Fahr.

Dr. Tritton has given, as the height of his instrument, 954 feet, calculated, by abbreviated formulæ, from Déra; the value adopted by us, however, is 1,026 feet, based on corresponding observations of Ágra, for detail of which see Part II., Area III.

10. *Pesháur*. The observations taken by Adolphe at this place during December, 1856, and January, 1857, served us for calculating our heights in the southern and western Pānjāb. The barometer, as well as the temperature of the air, was observed every two hours, from 6^h A.M. to 10^h P.M. We also have valuable observations, taken with an aneroid, from February 1 to March, 1857, by Dr. White. The correction of the aneroid, which had been carefully ascertained by comparison with one of Adolphe's barometers, is — 0·035 inch. Dr. White's thermometers had a correction of — 0°·9 Fahr. The details about the height of Pesháur will be given in Area III.

11. *Māssúri*. Colonel Waugh had made at this station some corresponding meteorological observations. They were taken at Gracemount (height 6,590 feet), by Mr. J. H. Hennesser, and also at Mary Villa, which, by simultaneous observations taken at Gracemount, we found to be 125 feet higher than the latter place, and therefore 6,715 feet.

The observations at Gracemount embrace eleven months, from December, 1855, to October, 1856; the barometer readings were taken about four times a day, but not always at the same hours. The temperature of the air, however, was observed more frequently. On term days, 24 hourly observations were registered. The readings at Mary Villa, of which few only coincide in time with our own observations, were generally taken twice a day, at 6^h A.M., and at 6^h P.M. They extend from December, 1855, to May, 1856.

12. *Banóg Hill*. These observations were made by Colonel Waugh, in April and May, 1853. The meteorological instruments were observed every hour, from

¹ See p. 16.

6^h A.M. to 6^h P.M. On term days the readings were taken every hour throughout the day and night.

Though the times were not simultaneous, yet, having no other data at our disposal, we were obliged to use Banóg Hill, as well as Símla and Mässúri, as corresponding stations for calculating heights in the other ranges of the Himálaya, in April and May, 1855, and from May to July, 1857.

13. *Símla*. We left barometer 12, Newman, as well as some thermometers, in the charge of a native, named Radhakishen, the schoolmaster of this station, by whom very good observations were taken, from May to December, 1856. He observed at 6^h and 10^h A.M., and at 2^h, 4^h, and 10^h P.M. The correctness of his readings is in great measure due to the kind attention of Lord William Hay, who volunteered from time to time to check his registers and observations.

The barometer was placed in the Government school-house, at an elevation of 7,057 feet, a result we obtained by simultaneous corresponding observations at Aln Cottage, our residence at that time. The latter we found to be 130 feet below the doorway of the church, which had previously been ascertained by the G. T. S. to be 7,156 feet above the level of the sea.¹

14. *Leh*. The height of Leh was calculated from Símla and Mässúri, from the observations taken in July, August, and September, 1856. The mean height of the cistern of the barometer was found to be 11,532 feet. The detail is given pp. 58 and 59. The sheds, in which our magnetic and meteorological instruments were put up, had been erected for the purpose close to the large house occupied by ourselves and assistants during our stay in Leh. This house is situated at the southern end of the town.²

C. SECONDARY CORRESPONDING STATIONS.

Besides the preceding fourteen principal stations, we were able occasionally to use as corresponding stations those places where a series of observations had been made, either by ourselves, or by our assistants, who very often were sent out along lateral routes to make corresponding observations on those points more especially which we had previously determined. Thus, Púna (where Adolphe had taken barometric

¹ The height of the church itself, from the doorway to the top of the spire, is 102 feet.

² See plate No. 9, 1st part of the Atlas of panoramas, views, and maps.

observations during the time of Hermann and Robert's march from Bombay to Púna) is used as corresponding station for calculating the heights determined between Bombay and Púna. Similarly, the heights determined by Adolphe and Robert during their excursion on the Milum glaciers are calculated from Milum and Δ Róghas, where Mr. Daniel and Eleazar, our assistants, had taken corresponding observations. These few, out of many similar instances, will suffice to explain the principle upon which, notwithstanding the great additional labour of calculation, we acted, in our endeavours to make a careful selection and combination of corresponding stations.

D. SELECTION OF THE CORRESPONDING STATIONS.

The selection of the right places for corresponding stations was sometimes a matter of serious and important consideration; often, indeed, a result was not arrived at until many and various calculations had enabled us to make a choice involving the smallest final errors. The accuracy of the final determination depends, not only on the number of the corresponding stations, but also on their respective climates and distances from each other. We had, therefore, to exclude many a station, which, if included in the deduction of the mean, would have decidedly affected the correctness of the result. As a general rule, we may draw attention to the fact, that corresponding stations in a north-southerly direction are always to be preferred to those lying east and west. This remarkable fact is most intimately connected with the direction of the wind, which in India and High Asia lies in general more from west to east, than from south to north. The direction itself of the wind plainly indicates along which lines irregularities of the temperature may be expected, for the wind always blows along the line connecting the greatest irregularities. In a line, therefore, perpendicular to the direction of the wind, must be sought the stations best situated for corresponding barometric observations. Also the necessity of admitting observations situated east and west as contemporaneous, which are not so absolutely, but only in reference to local time, must of course be the occasion of slight errors. If, however, the upper station is very high, or presents at the same time a considerable difference of latitude, the effect disappears.

At these results we have arrived by calculating our observations from various stations, often far distant from each other, and differing not only in height, but.

what in this case was of greater importance, in longitude and latitude also. Thus, when places due west of Leh, of not too great a relative elevation, are calculated from this point between the months of June and September, the heights resulting are too low. The same characteristic is to be noticed in winter time between Bengál and the Pánjáb. In Southern India, between Bombay and Madras, the reverse was observed in the winter of 1855.

On account of greater irregularities of climate, temperate zones are less favourable for barometric measurements of heights; nevertheless, many of the researches made in recent times with reference to this subject have given good results.¹

IV. CALCULATION OF BAROMETRIC HEIGHTS.

- I. FORMULÆ EMPLOYED.
- II. CORRECTIONS FOR PERIODIC CHANGES OF THE ELEMENTS. 1. General considerations. 2. Practical application to corrections. 3. Materials for the yearly period. *a.* Variation of the barometric heights in the yearly period. *b.* Comparison of the curves. *c.* Corrections for the months. 4. Materials for the daily period. *a.* Variation of the barometric heights in the daily period. *b.* Comparison of the curves. 5. General table of corrections.
- III. EXAMPLES. 1. Amarkántak, in Málva, Central India. 2. Musták pass, in Báltu, Tibet

I. FORMULÆ EMPLOYED.

For the calculation of our barometric heights we use the formulæ which have been extended from Gauss' tables by M. C. Dippe¹. But as Dippe's tables are based on Réaumur, and give the resulting height in toises, we had, for one argument, viz. the sum of the temperatures of the air ($t + t'$), to reduce the table to Fahrenheit and centigrade measure, and to alter the argument for the correction with the decrease of gravity.

In accordance with Bessel's calculations, we have added a special correction for introducing the mean humidity *with its full value*. We had, however, to reduce Bessel's table (which is contained in "Schumacher's Astronomische Nachrichten", 1838, No. 356), to English measures, and to extend it, so as to make it available for extreme heights. All the tables required either for the barometrical or trigonometrical calculation of heights are given in full at the end of this part; they also contain the

¹ Gauss' tables, a re-calculation of La Place's original formulæ, are published in "Schumacher's Jahrbuch for 1836"; Dippe's tables, in the "Astronomische Nachrichten, No. 1056, November, 1856". The co-efficients used in these tables have been recently confirmed by the *theoretical* researches of Professor Crelle: Einige Bemerkungen über die Theorie des Höhenmessens; Abhandlungen der Berliner Akademie, 1852.

barometric pressures corresponding to temperatures of boiling water, in English and French measures.¹

The mean of the humidity² at the lower and upper station (the maximum humidity being 1) is to be multiplied with the corresponding number of the table No. 4, p. 77, the heading of one of which is "half the sum of the temperatures of the atmosphere" at the stations, and the other, "the relative height" between the two stations. The product thus obtained (always additive) is in English feet. An inspection of the table shows, that the numbers increase with height, moisture, and temperature, and that for tropical countries (on account of temperature), or for great relative heights, the value becomes a very appreciable element in the final determination.

The method employed by us for the calculation of our heights will best be seen from the examples, given pp. 62—64.

II. CORRECTIONS FOR PERIODIC CHANGES OF THE ELEMENTS.

The results of barometric determinations of height are still to be corrected for the periodic changes of the respective elements, and as we have to determine the absolute values of these disturbances, we meet with questions of a most complicated and difficult nature.

1. GENERAL CONSIDERATIONS.

If the observations for the pressure and temperature of the atmosphere at the two respective stations could be considered as representing, in their relation, *the true mean* along the direct ideal line connecting the two stations, the results of barometric observations would become independent of the yearly and daily period.

But that this is not the case, and that the heights obtained are affected by periodic variations, is confirmed by theory, as well as by the results deduced. The amount of these variations we propose to analyse in the subsequent pages.

¹ A valuable collection of various tables is also contained in Guyot's "Tables, meteorological and physical, prepared for the Smithsonian Institution." Second edition, Washington, 1858.

² The humidity has been calculated from the simultaneous readings of the dry and wet bulb thermometer, as first proposed by August. Since his discovery, minute tables have been calculated and published by Regnault, Glaisher, and others. Humidity—relative humidity, or degree of saturation—gives the proportion of the actual to the possible quantity of moisture in the atmosphere when completely saturated. The degree of complete saturation is occasionally represented by 100, a unit which we have adopted in the present volume.

Following the plan adopted in our analysis of barometric calculations in the Alps (published some years ago¹), we shall begin with some theoretical considerations.

The equation for the calculation of heights by observations with the barometer is known to be of the form

$$z = a (1 + cT) \log \frac{B}{b} + \&c.,$$

where a and c are constants, B , b , the observations of the barometer at the lower and upper stations respectively, and T the arithmetical mean of the temperature at both stations, &c.

The variation of gravity, depending upon height and latitude, as well as the humidity of the atmosphere, having but comparatively small influence, we may, in order to obviate undue complication, consider z as depending upon T , B , b , only, viz.:

$$z = f (T, B, b, \&c.).$$

Then we have:

$$\Delta z = \frac{df}{dT} \cdot \Delta T + \frac{df}{dB} \cdot \Delta B + \frac{df}{db} \cdot \Delta b + \&c.$$

By forming the partial differential quotients, we get

$$\frac{dz}{dT} \cdot \Delta T = ac \log \frac{B}{b} \Delta T \quad (1)$$

$$\frac{dz}{dB} \cdot \Delta B = a (1 + cT) \frac{m}{B} \cdot \Delta B \quad (2)$$

$$\frac{dz}{db} \cdot \Delta b = -a(1 + cT) \frac{m}{b} \cdot \Delta b \quad (3).$$

therefore

$$\Delta z = ac \log \frac{B}{b} + ma(1 + cT) \left(\frac{\Delta B}{B} - \frac{\Delta b}{b} \right).$$

Assuming that the barometric pressure has been correctly read at both stations, viz. at the place whose height is to be calculated and the other corresponding one, we find from the equations 2 and 3, that if $\Delta B = \Delta b$,

$$\frac{dz}{dB} \cdot \Delta B : \frac{dz}{db} \cdot \Delta b = b : B.$$

Therefore, a deviation from the regular period in the daily variation of the atmospheric pressure exercises a greater influence if the corresponding station (the starting point) be the higher one, than if it be the lower. But this result will be seen, for all practical purposes, to be of very little importance, when we consider, that the periodic variations of the atmospheric pressure, as also the other irregular

¹ See H. de Schlagintweit's memoir on this subject, in "Neue Untersuchungen über die Alpen", Leipzig, 1854, pp. 399 et seq.

variations, are generally greater for the station of less elevation. Taking this latter as the starting point, there is, however, every probability of the irregularities, so far as they enter into the calculation, being sensibly reduced.

The absolute error of the resulting height is proportional to the error in the barometric pressure at the corresponding station; the determination of this element, therefore, may be considered as amply satisfying the condition of accuracy, when the instruments are in good order, and their readings carefully taken.

The conditions depending on temperature, however, are much less favourable. The equation No. 1 is of such a form, that the influences introduced by errors of the temperature (ΔT) can be appreciated. If (for abbreviation) we make $a \log \frac{B}{b} = z'$ the approximate difference of the resulting height, we then get $\Delta z = c z' \Delta T$.

The absolute error, therefore, is

- 1) directly proportional to the error in the temperature, and
- 2) increases with the relative height between the two stations.

2. PRACTICAL APPLICATION TO CORRECTIONS.

Now, what we call T , or the arithmetical mean between the temperatures of the two stations, is, in precise terms, the mean of the temperatures of the air near the surface of the ground at the place of observation. Its difference from the temperature which we should obtain, if it were possible properly to define the real mean temperature of the free air *along the oblique line* connecting the two stations, becomes the principal source of error in the calculation of barometric heights, and this error will vary both with the seasons and with the daily thermic period.

In deducing corrections for practical purposes, we depend chiefly upon the thermic element. The yearly and the daily period we shall consider separately, first establishing the corrections for the respective months, then for the hours within the months.

As the unit to which the deviations are to be referred, we may take either the difference of level established by trigonometric operations, or for small distances, when both stations are included within the same type of climate, the mean of the 12 months. The differences thus obtained will also include, as an immediate consequence of these considerations, the periodic deviations depending on inequality of atmospheric pressure. But, as has been said before, the latter are comparatively very small.

3. MATERIALS FOR THE YEARLY PERIOD.

The following groups contain the materials which we were able to collect for the yearly period:

1. AMBÁLA—ÁGRA, representing the climate of Hindostán and Central India for minor elevations. The data are taken from the observations for the year 1854, as contained in our manuscript books. Previous to our examining the instruments and setting them in order for our corresponding observations in 1855, their correction amounted to a value, corresponding to a mean difference of ± 51 feet, which has been already applied to the results presented.¹

2. MAHABALÉSHVAR—BOMBAY, combining the sea shore and the Dékhan. For want of a closer coincidence in point of time, we were obliged to combine, for Mahabaléshvar, the barometer for 1828-9, and a mean temperature of nine years (1835—43), with the values for 1843 at Bombay. This year we selected both from its approximation to the Mahabaléshvar period, and as presenting, in its temperature and pressure, but a trifling divergence from the true mean. The data are taken from Colonel Sykes' important memoir on Indian meteorology.² The locality where the barometer had been observed at Mahabaléshvar is unknown.

3. DODABÉTTA—MADRAS, for great elevations in Southern India, from observations for 1850 in the records communicated to us by the Madras Government. In this group the variation for the different months is well shown, but the mean yearly result is decidedly too low, chiefly on account of the errors of the instruments not being sufficiently well known. These errors amount to a value of ± 83 feet, which have been applied to the final heights.

4. DARJÍLING—CALCUTTA, for nine months. This combination also may be expected to be unfavourable, on account of discrepancies of the meteorological character; nevertheless, the amount of error is only a small one.

The following tables contain, besides the data used for calculation, the results obtained and the monthly variation of difference. The general results are also repre-

¹ Though the stations of series of thermometric observations (which will appear in the Vols. on Meteorology) are very numerous, yet it was not easy to find long series of exact barometric observations, indeed it was hardly possible to procure them, even when all the arrangements that seemed necessary had been made. In the three years' observations for these two stations, the series for 1854 is the one most complete.

General Remarks

In representing the periodic variation, the rise of the curves corresponds to an increase of apparent relative height. J, F, M, etc. are the abbreviations for the months January, February, March etc.

Engraved and published by T. A. Brockhaus, Leipzig 1861

Scale.

b. COMPARISON OF THE CURVES.

We now proceed to an analysis of the curves in reference to the variations of the resulting heights. Also for meteorology in general such considerations are not without interest. As a rule, the variations of the barometer are at both stations in the same direction, and of an amount slightly differing from one period to another. The same is the case, more or less, with the wind and the temperature near the surface. The results represented in plates 1 and 2, will, therefore, furnish useful data for forming a correct idea of the temperature of the *free* atmosphere.

In Europe, and in moderate zones generally, the character of the climate varies much more rapidly in proportion to distance, and considerations like the following for the monthly variation of the barometric heights must necessarily be confined to the comparison of localities much less distant from each other.

Irregular as the curves may at first appear, they show many coincidences in their general character, when the respective climates to which they belong, are taken into consideration.

a. In all of them February, or March, is considerably too low, or, which is the same, the temperature of the soil is lower, even during the gradual approach of the hot season, than that of the atmosphere.

b. The curve attains its first maximum a short time before the setting in of the rains. During the whole of this period, the surface of the earth, and the strata of the atmosphere immediately above it, are in excess of temperature as compared to the free atmosphere.

c. The rainy season is characterised by a very steep and rapid descent of the curve.¹ This deflection results from the lower strata of the atmosphere being comparatively more cooled by rains than the upper, in consequence of the evaporation,

¹ We had also calculated in full detail Ágra—Calcutta, and Ágra—Bombay, both of which show with considerable distinctness the depression of the curve in July, after the setting in of the rains; but it is evident, from the great distance between them, and more particularly from the marked difference in the direction of the wind, that they could not be connected with the question before us. Though the absolute height of Ágra is 657 feet, we get from Calcutta, as maximum, in June, 613 feet, as minimum, in December, 504 feet. Ágra, combined with Bombay, gives as maximum, in June, 742 feet, as minimum, in December, 416 feet. These numbers are deduced from the monthly means of barometers and thermometers, &c., for 1854. Care must be taken not to combine Himalayan stations with those in the plains of India. As an example of incorrect combination, we instance Darjiling—Calcutta; Simla also, as calculated from Ambála, gives a decidedly inaccurate result for the relative height.

which takes place chiefly on the surface of the ground and not in the free atmosphere.¹ ●

After the ground is thoroughly saturated with moisture, there is an analogous rise of the curves, which, in those parts where the rain is not excessive (as in Hindostán), gradually merges into the autumnal division of the curves. But in the regions of excessive rain, the period of the drying up of the ground corresponds to another depression of the curve.

d. In autumn again, during the first approach of the cool season, there is another decided rise, chiefly in connection with the uninterrupted action of the sun through a cloudless sky on the surface of the ground.²

c. CORRECTIONS FOR THE MONTHS.

As resulting corrections for the months, we obtain the following: *a.* In Southern India in general the correction for April, October, November, December, comes to -0.003 of the relative height; for March and June to $+0.003$, while it may be altogether disregarded for the other months. *b.* For the rest of India, including the Himálaya, it may be considered as being, in February and during the height of the rains, $+0.002$; during the hottest period of the year, just before the beginning of the rains, and for October, November, and December, -0.0015 . *c.* The same corrections as those of *b* were applied to Himálayan stations, situated within the region of periodical rain, but for Tibetan stations a depression contemporaneous to the period of Himálayan rains seems entirely wanting. The absolute height of Leh, for instance, is 11,532 feet.

It becomes:

1856.	Calculated from Massúri.	Calculated from Símla.
July	11,528	11,541
August	11,558	11,527
September	11,513	11,523

¹ See our observations on the *temperature* of rain, in the meteorological parts of our publications.

² In the Alps the autumn is one of the best seasons for barometric observations; a correction for this season is inappreciable.

4. MATERIALS FOR THE DAILY PERIOD.

The variation of the resulting height with the daily period is very considerable for climates having a large daily range of temperature. We had, however, greater facilities for defining the amount of these variations than in the calculation of the yearly period. From a numerous collection of such observations we select six series, which will be quite sufficient for deducing the corrections required. We of course define the variation within the daily period as the difference of the respective hour, not from the yearly or corrected mean, but from the monthly mean of the 24 hours. At all the different stations, the hours of direct observations included the period from 6^h A.M. to 10^h P.M. The respective elements for the night (at midnight, 2^h A.M., and 4^h A.M.) had to be calculated by a formula of interpolation, which will be used, and communicated in detail, in the volume treating of the special objects of meteorology.¹

Though considerably increasing the labour of calculation, we found it the better plan first to deduce by interpolation the respective meteorological elements, and then to proceed with calculating the height for the hours of the night, as we give them in the curves.

We present the following series:

A. FOR INDIA.

1. AMBÁLA—ÁGRA, mean for the month of December, 1854. These curves are intended as the type of Hindostán.
2. PÚNA—BOMBAY, from Adolphe's observations taken from December 29, 1854, to January 5, 1855, near the dāk bángalo. To reduce the results to the door-way of the dāk bángalo, a local correction of — 15 feet had to be applied.
3. KĀLÁDGHĪ—BOMBAY, from our observations, January 17—20, 1855. They refer to the door-way of the travellers' bángalo.
4. SÁGER—ÁGRA, from Robert's observations, December 14—18, 1855, referred to the door-way of the travellers' bángalo. The local correction of — 5 feet is applied to the results.

¹ For the present we refer to our "Neue Untersuchungen über die Alpen," p. 384. *et seq.*

5. FÄLÖT—DARJILING, from Hermann's observations taken from May 26 to June 10, 1855, during the height of the rainy season. By trigonometric measurement, the barometer was found to be put up 204 feet below the summit of Fälöt, for which we adopt the value of the G. T. S. = 12,042 feet. The cistern of the barometer was therefore 11,838 feet above the level of the sea.

6. LEH—MASSURI, and LEH—SIMLA, for three months, July, August, and September, 1856, from observations by Hermann, Robert, and Härkishen.

The curves, on the same scale for the vertical co-ordinates as those of the yearly period, (see p. 52) are collected in plate No. 2, and represent the entire daily period.

VARIATION OF THE BAROMETRIC HEIGHTS IN THE DAILY PERIOD.

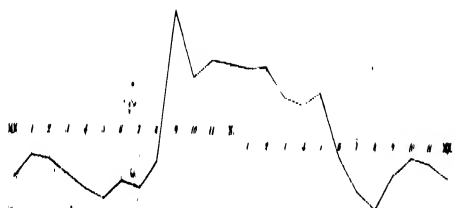

Messrs de Schlingensiefen India and High Asia

To face p 56

Vol II Plate 9

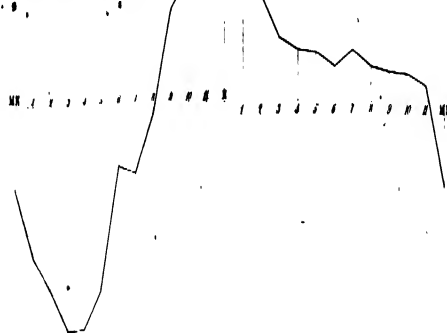

1. Ambala Agra, 1855, December.

Lat. N. $30^{\circ}21'41''$ $27^{\circ}10'41''$
 Long. E. $76^{\circ}48'8''$ $78^{\circ}1'7''$
 Height 1076 ft. 657 ft.
 Difference of height 369 ft.

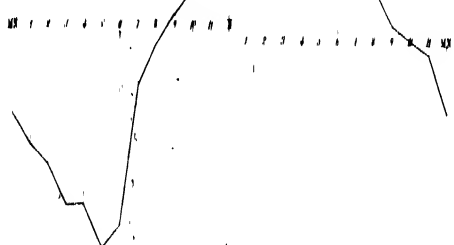

5. Faidi Darjiling, 1855, May and June.

Lat. N. $27^{\circ}13'7''$ $27^{\circ}3'0''$
 Long. E. $87^{\circ}58'8''$ $88^{\circ}6'3''$
 Height 11338 ft. 7168 ft.
 Difference of height 4670 ft.

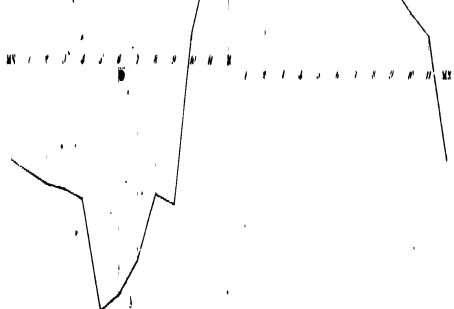

2. Puna Bombay, 1855.

Lat. N. $18^{\circ}30'41''$ $18^{\circ}53'5''$
 Long. E. $73^{\circ}52'1''$ $72^{\circ}40'1''$
 Height 1744 ft. 38 ft.
 Difference of height 1746 ft.

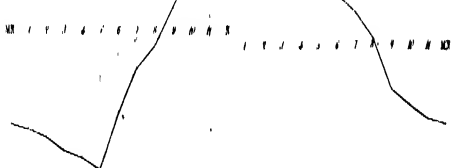

3. Kalaighi Bombay, 1855, January.

Lat. N. $18^{\circ}19'9''$ $18^{\circ}13'5''$
 Long. E. $73^{\circ}29'9''$ $72^{\circ}49'1''$
 Height 1744 ft. 38 ft.
 Difference of height 1706 ft.

4. Sager Agra, 1855, December.

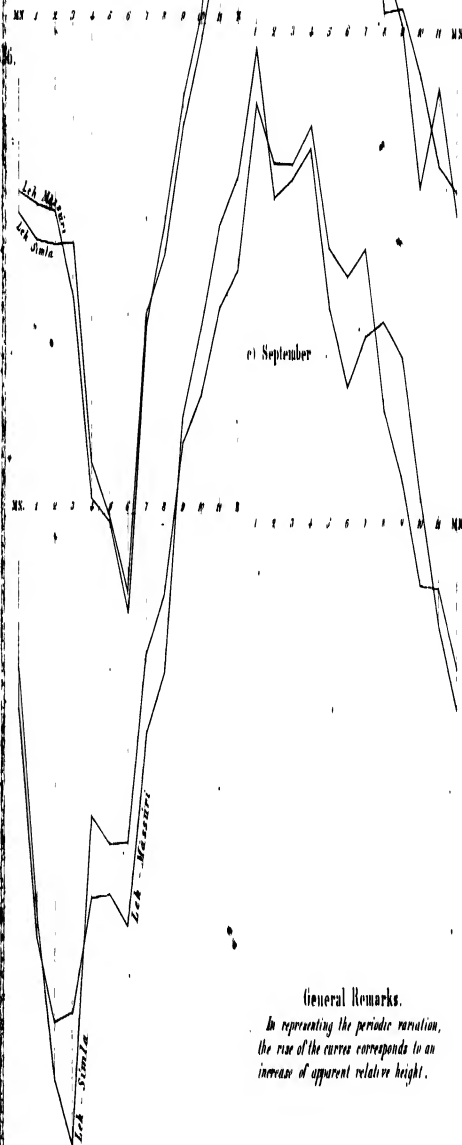

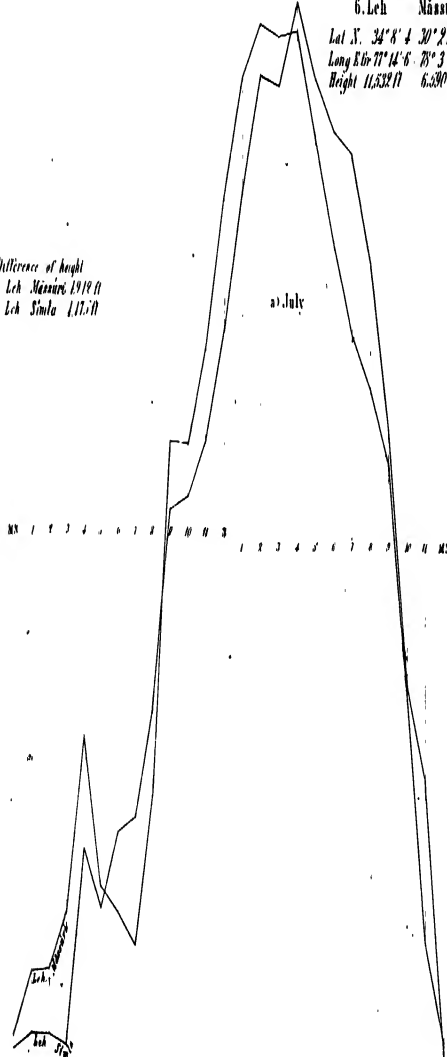

Lat. N. $23^{\circ}30'2''$ $27^{\circ}10'4''$
 Long. E. $78^{\circ}43'4''$ $78^{\circ}1'7''$
 Height 1880 ft. 657 ft.
 Difference of height 2223 ft.

6. Leh Mansuri Simla, 1856.

Lat. N. $34^{\circ}8'4''$ $30^{\circ}27'6''$ $31^{\circ}6'1''$
 Long. E. $77^{\circ}14'6''$ $78^{\circ}3'0''$ $77^{\circ}1'6''$
 Height 11532 ft. 6590 ft. 7157 ft.

Difference of height
 Leh Mansuri 1919 ft.
 Leh Simla 1115 ft.

General Remarks.

In representing the periodic variation, the rise of the curve corresponds to an increase of apparent relative height.

Engraved and published by F. A. Brockhaus, Leipzig, 1861.

Scale.
 1 inch to 20 feet, 1/16 inch to 200 feet.

3. Kālādghi—Bombay.							4. Sāger—Āgra.						
As absolute height of Kālādghi we adopt: 1,744 feet, being the mean of the hourly Observations. Loc. <i>Dāk bāngalo</i> .							As absolute height of Sāger we adopt: 1,880 feet, being the mean of the hourly Observations. Loc. <i>Dāk bāngalo</i> .

b. COMPARISON OF THE CURVES.

a. As a principal feature common to all these curves it must be mentioned, that they have a minimum at about one or two hours before sunrise, and a period of maximum from about 11^h A.M. to 5^h P.M. The form of this maximum, however, is irregular, and immediately dependant upon local circumstances; in several of the cases before us, there is a secondary depression at about 1^h or 2^h P.M. succeeded by a corresponding rise.

b. All the curves twice attain their mean value, once during the hours A.M., once during P.M.; but at the same time it is evident that the A.M. value is by far the better defined one, since for all curves and for all seasons it is included between 8^h and 10^h A.M.;¹ whilst the P.M. value presents itself between 4^h and 11^h P.M., and occurs altogether in a much more irregular part of the curve.

¹ Dr. G. de Liebig also in his detailed and most careful observations on the Parisnâth hill, April, 1856, has found 9^h 30^m A.M. to be the best hour. See Journal of the Asiatic Society, 1858, No. I.

c. In general the range of the daily period increases to a certain extent with the relative height;¹ but if we divide the differences by the relative height we find the results decrease a little, whilst the relative height increases.

d. For practical purposes it is advisable to take, if possible, the mean of 8^h, 9^h, and 10^h A.M., or the combination of 6^h A.M. with 3^h or 4^h P.M.

The great number of our observations (taken also, as they were, for meteorological purposes) allowed in general of a direct selection of the most favourable hours, but the necessities of travelling continually interfere with the observer's choice of the times best suited for the required measurements, and, in order to lessen the imperfections thus incidental to the mode of observation, we have given in the following tables an hourly correction, expressed in decimals of the relative heights, which was derived from the preceding observations. We made three groups: viz. for relative heights of 400 feet, of 1,000 feet, and 1,600 feet.

The results differ so little between the second and third groups, that, for values above 1,600 feet the co-efficient of the hourly correction seems to remain about the same. But this co-efficient is referred only to India and to those parts of High Asia including one, at least, of the combined stations, which is situated in the rainy district of the Himālaya, and of absolute height not exceeding 12,000 feet.²

e. For Himālayan and Tibetan stations, situated at great absolute heights, as well as in general for those in the dry parts of Tibet and Turkistán, the corrections depending on the daily variation had to be deduced for each district respectively. In these regions, also, we were enabled from the great number of our observations, to obtain well defined results for the hourly corrections. These have been given with the detail of the stations themselves, in order to avoid unnecessary complication in the general table.

¹ Compare similar researches in Europe: by Dr. Berghaus, in his "Grundriss der Geographie"; Bravais, *Comptes rendus*, 1850, p. 175; and our observations at the Vincent's Hütte. In Europe more especially, where the yearly variation is so considerable, it is very important to refer the difference of height, not to the yearly mean, but to the respective monthly means; otherwise, the hour giving the best result not only changes from month to month, but, what is more serious, we get for the month a resulting value depending upon hours, which, from their place in the daily period, give results much less strictly defined than others.

² The corrections are carried out to two decimals only, an accuracy quite sufficient, if we consider that isolated observations of one or two days must still remain affected by the error depending on non-periodical and irregular disturbances in pressure, temperature, wind, &c.

5. GENERAL TABLE OF CORRECTIONS,

for the Relative Height, depending on the Daily and Yearly Variations.

The relative height is to be corrected by multiplying it with the co-efficients for the respective month and hour, which are given in the following table.

At each of our observations we have added the amount of this correction, which for longer series is marked *Per. Corr.* == Periodic correction.

Corrections for the Hours.				Corrections for the Months		
Hour.	Relative Height.			Month.	Southern India.	India and the Outer Himalaya.

For the calculation of the heights, which were ascertained barometrically by ourselves, we have chosen only such readings as, on account of the season and the hour, were the most favourable for the final result. A great many more observations, however, were taken, which will be treated in Vols IV. and V. of our publications (meteorology) under the special head of the variations of barometric pressure.

The detail required for the calculation we have shown as necessary in full, but for localities of secondary importance, ascertained occasionally by aneroids, the station only to which they are referred, and the resulting height, have been quoted.

III. EXAMPLES.

1. *A* = Amarkántak, Latitude N. $22^{\circ} 38'$, Longitude E. Green. $81^{\circ} 46'$, in Málva, Central India.
 Loc. *Mean height of plateau Vishnupúri.*

1856, Jan. 22, 7^h P.M. Observer: Robert. Thermo-barom. 7, Geissler.

Geographical Co-ordinates of the Corresponding Stations.

Corresponding Stations.	Latitude North.	Longitude East Green.	Height.
<i>B.</i> Ágra . . .	$27^{\circ} 10' 26''$	$78^{\circ} 1' 39''$	Feet. 657
<i>C.</i> Aligárh . .	$27^{\circ} 53' 50''$	$78^{\circ} 3' 55''$	750

Hypsometric Observations.

Stations.	English Scale.		French Scale.		Humidity.
	Boiling-Point.	Air.	Boiling-Point.	Air.	
<i>A.</i> Amarkántak {	$206^{\circ} \cdot 12$ Fahr. = $26 \cdot 588$ inches	$75 \cdot 6$	$96^{\circ} \cdot 73$ C. = $675 \cdot 3$ millim.	$24 \cdot 2$	30
Corresponding { <i>B.</i> Ágra,	$29 \cdot 473$ „	$75 \cdot 0$	$748 \cdot 6$ „	$23 \cdot 9$	44
Stations { <i>C.</i> Aligárh	$29 \cdot 375$ „	$73 \cdot 6$	$746 \cdot 1$ „	$23 \cdot 1$	50

As inches and Fahrenheit cannot be always reduced, with perfect identity of the decimals, to millimetres and Centigrade, it is evident, that there must be occasionally slight differences in the height, when calculated by the English and at the same time by the French scale. These differences are, however, of no importance for the definitive result, which is generally based on the mean of several stations and observations.

Calculation.

The mean of these observations, combined with others which will be given later, gives as absolute height for the Musták pass: 19,019 feet.

V. TRIGONOMETRIC MEASUREMENT OF HEIGHTS AND DISTANCES.

- I. INSTRUMENTS: Theodolites, pocket sextants, and vertical circles.
- II. METHOD OF OPERATION.
- III. DESIGNATION OF THE OBJECTS MEASURED.
- IV. VALUES AND FORMULÆ ADOPTED.
- V. EXAMPLE.

I. INSTRUMENTS.

In the Himálaya and the elevated districts in the north which have been but partially explored as yet, we frequently made use of theodolites for the determination of heights, the determination of the latitude and longitude being at the same time obtained.

We had five theodolites with us, two of which were divided into 20"; and the other three into 30". A detailed description of these instruments has been given in connection with our astronomical and magnetic observations.¹

Pocket sextants, as well as vertical circles,² were occasionally used for determining small differences of level.

In the choice of localities for our operations, we took particular care to select such places as not only allowed of a considerable part of the mountain chains being surveyed at once, but also presented at the same time the opportunity of connecting the results with our panoramas and drawings. As our observations were made during the actual progress of our journeys, it was not possible to connect each single series

¹ See Vol. I., pp. 73 to 76.

² A description and a figure of this instrument is given in "Neue Untersuchungen über die Alpen, by H. and A. S. 1854," p. 128.

with each other; in many cases the latitude, longitude, and azimuth of the base line were determined in immediate connection with our astronomical and magnetic observations.

II. METHOD OF OPERATION.

Our method of procedure was generally as follows. First a small line was directly measured, and was then connected by triangulation with a larger line, which then served as our final basis. Its length could be controlled again by measuring an analogous line for verification near its other end.

In many instances we were able directly to define our base line by angles taken to points fixed by the Great Trigonometric Survey; moreover, in general our vertical angles, even for high peaks, were very large, while the distances, on the other hand, were very small; a circumstance which, from the nature of the formulæ, considerably increases the accuracy of the result.

We may be allowed to mention the bearings and angular elevations taken in connection with our numerous panoramas and drawings. For every object of some extent, a tracing (in India generally executed by our assistants) has been made, in which the angles obtained are written immediately near the objects measured, a process admitting of considerable precision in defining the individuality of the mountains, &c. The drawings proved of material assistance in recognising the principal objects, when seen in another than the usual direction, since the general profile of dominant peaks shows very little alteration at different angles, when the points of observation are not too distant from each other.

Many of our angles could not be used for calculating heights or distances, as some of the objects were visible from only one place, but even these isolated angles have been used in completing the detail of our maps.

III. DESIGNATION OF THE OBJECTS MEASURED.

Occasionally, we experienced considerable difficulty in finding names for the different objects, as they were measured. The custom of other geographers in similar instances is to distinguish them by an arbitrary number, or initial, with latitude, longitude, and height annexed. The difficulty in our case, however, was incidental

only to the higher uninhabited regions, and even here we found that, in those parts where Brahmanism had obtained a footing, many a snowy peak of striking aspect had been distinguished by names intimately connected with Hindu Mythology, as, Chamlári, Gaurisánkar, Nánda Dévi,¹ &c. In Tibet and Turkistán, many of the peaks were known to the natives by a name which repeated inquiries proved to be no arbitrary one; and of these we were enabled to avail ourselves. Whenever such designations were wanting, we endeavoured to supply the deficiency by those of any well defined object, such as passes, glaciers, valleys, rivers, springs, &c. in their immediate neighbourhood; for in High Asia such objects are sufficiently distinguished by popular and characteristic names, with which, as we carried on our operations not down in the plains, but in the interior of the country, we had every opportunity of getting a correct and intimate acquaintance.² Nevertheless, we were obliged, in some instances, to have recourse to numbers or signs.

IV. VALUES AND FORMULÆ EMPLOYED.

The dimensions of the earth supposed to be a spheroid are taken in our computations at the following values:

Axis Major $a = 20922931 \cdot 8$ feet,

Axis Minor $b = 20853374 \cdot 6$ feet.

These elements are derived from a comparison of the Dodagónta arc (comprised between Punna and Kuliánpur,³ and measured by the Great Trigonometrical Survey prior to 1826) with the French arc beginning at Greenwich and ending at Formentera.⁴

For registering and computing, we adopt in general the form used in the G. T. Survey, with which some of our assistants had been previously familiar. It will be

¹ In the second part of Vol. III. will be given a glossary, containing the signification and transcription of various geographical and ethnographical names.

² Also in the Alps, such objects had not been designated by names before the time when a livelier sense of the necessity of geographical precision became general. It may be remembered that Saussure, in his first scientific exploration of the Alps, found Montblanc without a name well defining the peak: its individuality being merged along with the surrounding region under the general appellation of *Monts maudits*.

³ The measurement of the Indian arc, begun by Lambton and continued by Everest and Waugh, extends now over $21^{\circ} 21' 16'' \cdot 6$.

⁴ Compare the values obtained by other measurements of arc: T. de Schubert, "*Essai d'une détermination de la véritable figure de la terre*," St. Petersbourg, 1859, and "Madler's recent notice on the true figure of the earth," in Heis' *Wochenschrift*, Dec. 1855.

found to contain all the necessary elements, which are arranged with the utmost care and completeness. A detailed example is given pp. 69 and 70.

For our trigonometrical heights we indicate only the eye station, viz. the place from which they have been measured. We exclude any further detail which is not so necessary in this case as in barometrical observations, where the result depends, in a great measure, upon the selection of the corresponding station and general state of the atmosphere. These conditions, although influencing in some degree trigonometrical observations, are nevertheless not of the same importance as those for the determination of barometrical heights.

Refraction. For the terrestrial refraction we adopt for the Western Himálaya and Tibet: $\frac{1}{16.7} = 0.060$ of the contained arc. We have deduced this mean value from Capt. T. J. Montgomerie's latest determinations by reciprocal observations during his survey of the Kashmir series, being influenced in our choice by the circumstance of the province for which it was determined possessing a climate much more analogous to that of High Asia in general, than to the more tropical climate of India Proper.¹

The logarithms used for the respective latitudes in the calculation of the contained arc, are given in a special table at the end of this chapter.

We further append the method given by Savitch, in the "Bulletin de l'Académie de St. Pétersbourg, 1855," for calculating the co-efficient of terrestrial refraction for the favourable state of the atmosphere, viz. for the case when the objects observed in the telescope appear steady. If

μ = the co-efficient of terrestrial refraction,

C = the geodetic arc between the observer and the object (contained arc), expressed in seconds,

x = the relative height of the object,

D = the distance of the object from the observer,

R = the radius of the earth, or, more precisely, the radius of curvature, } in
English
feet.

¹ For India, the value of the refraction is generally found to be about $\frac{1}{15}$ of the contained arc. In Sikkim, the G. T. S. had found by direct determinations, for the months of October and November, the mean terrestrial refraction to be $\frac{1}{13.2}$ of the contained arc, a value which we have also adopted for this region. See "Thuillier's Manual of Surveying," London, 1855, Appendix II. An interesting table of refraction is also given in Vol. XIV., p. 316, of the Asiatic Researches, in Hodgson's and Herbert's elaborate "Account of the Himálaya Mountains."

H = the apparent vertical elevation of the object,
then we have:

$$D' = D \left(1 - \frac{D^2}{24 R^2} \right) \text{ i. e. } D' \text{ is nearly } = D$$

$$x = D' \times \frac{\sin \left(h + \frac{1}{2} C - \mu C \right)}{\cos \left(h + C - \mu C \right)}; \quad C = \frac{D}{R \sin 1''}.$$

For obtaining the co-efficient μ , the readings of the barometer and thermometer are required.

If

t = temperature of the air at the station of the observer in Fahrenheit.

t' = 68°·0 Fahr. or adopted standard temperature,

b = the height of the barometer in English inches, reduced to 32° Fahr.

b' = 29·0 English inches,

we have to calculate first

$$s' = \frac{2}{3} \sin C \times \tan \left(h + 0·3 C \right),$$

and then we have

$$\mu = 0·094 \frac{b}{b'} \times \left(\frac{1}{1 + 0·00204 (t - t')} \right)^3 \left(\frac{1}{1 + 172 s'} \right)^3.$$

V. EXAMPLE.

Trigonometric measurement of the snow peak Tök, in Ladák.

This peak was measured 1856, July 19, from Lárímo, a well marked peak, situated 6,718 feet N. 86° 33' 46" E. of Leh, the capital of Ladák.

Geographical co-ordinates of Lárímo peak = Eye station.

Latitude N. 34° 8' 25". Long. E. Gr. 77° 15' 56". Height: 13,293 feet.

1. Calculation of the height of Tök peak.

Distance from Lárímo peak to Tök peak	91,985 feet.	
Logarithm of the distance in feet	4·9637170	Subtended angle 4° 48' 41·5 log sin 8·9236498

PART II.

HEIGHTS DETERMINED IN INDIA.

In order to obtain a general hypsometrical tableau of the countries examined, we have divided India and High Asia into various areas, as shown on plate No. 3; through each of them a line is drawn, connecting some of the principal places, and the succession of the heights determined to the right or left of this line follows its mean direction as indicated by an arrow. This Index map contains the following areas, which we call meridional, longitudinal, diagonal, or transversal, according to the relative position of the leading lines.

Each area is preceded by general topographical remarks.

A. INDIA.

- Area I. Assám and delta of the Brahmapútra and Ganges, with the Nága, Khassia, and Gárro hills, and some remarks about the Iravádi.
Longitudinal, from east to west: Brahmakúnd viâ Rajmahál to the Sanderbáns.
- „ II. Hindostán along the Ganges. Longitudinal, from west to east: Sahárapur viâ Khánpur to Rajmahál.
- „ III. Pänjáb to Gujrát. Meridional, from north to south: Átak viâ Mitháunkot to Diu.
- „ IV. Central India. Meridional, from north to south: from the Ganges viâ Nágpur and Ohánda to Koringa.
- „ V. Dékhan and Maissúr. Diagonal, from north-west to south-east: Bombay viâ Pána and Bellári to Madras.
- „ VI. Karnátik and Nilgiris, with an appendix on Ceylon. Longitudinal, from west to east: Madras viâ Bángalur and Utakamánd to Kalikát.

B. HIGH ASIA.

- Area VII. Himálaya of Bhután, Sikkím, and Nepál. Longitudinal, from east to west: Bhután viâ Darjiling to west of Kathmándu.
- „ VIII. Western Himálaya, from Kámáon to Hazára. Diagonal, from south-east to north-west: Almóra viâ Simla and Srinágger to Rajáur.

- IX. Central chain of Western Tibet. From south-east to north-west: east of the Mansarúur lake to Skárdo.
- X. Principal snow peaks of the western parts of the Karakorúm chain. From east to west: east of the Namur lake to west of the lake Sirikúl.
- XI. Transversal sections across Tibet, partially continued across the Kuenlúen.
a. Níti — Gártok. *b.* Vángtu — Pangkóng. *c.* Kárdong — Karakorúm chain.
d. Pádum — Leh. *e.* Múlbe — Kiúk Kiöl — Élehi. *f.* Dras — Shígar — Yárkand.
a - c, are diagonal lines from south-west to north-east, *f*, is a meridional line from south to north.
- These lines are considered to be situated in the centre of an area, limited by half their mutual distance.

The general form in which the detail of our barometric observations is given within the respective areas, will be best seen from the following example (Area V., No. 20):

No. 20. Bhör Ghāt, Lat. N. $18^{\circ} 44'$, Long. E. Gr. $73^{\circ} 22'$, in the Dékhan.

3, Oertling. 1855, Jan. 2. *B* = Bombay. *C* = Púna.

8^h 45^m A.M. *A.* 28 131; 68.0; 77. *B.* 29 944; 70.0; 77. — 30. — 1,801. *C.* 28 142; 65 1; 64. = 1,795.

The "No." is merely given to facilitate later quotations. In each area the stations begin with No. 1.

The observation at the Bhör Ghāt was taken 1855, January 2, 8^h 45^m A.M., with the barometer 3, Oertling. "*A*" indicates the station to be calculated. If a thermometer is used, the degrees in Fahrenheit¹ are given instead of the barometric pressure. The instruments are corrected, and the barometers reduced to 32° Fahr. After the barometric pressure follows the temperature of the air in Fahrenheit, and the moisture, the degree of saturation being 100. The corresponding stations are either given in full, or marked *B. C. D.*

After the moisture at the corresponding station, the amount of the periodic correction (see p. 61) is given in feet, and then the absolute resulting height. The definitive absolute height is deduced from the mean of all observations. If the periodic correction is 0 throughout the corresponding stations, it is left out entirely. The designation of the instrument always refers to that used in the station to be determined, viz. station *A*; the instruments at the different corresponding stations are given pp. 40—44.

¹ The degrees can be easily reduced into the corresponding barometric pressure, expressed in inches, by reference to the table, pp. 80—83.

AREA I.

ASSÁM AND DELTA OF THE BRAHMAPÚTRA AND GANGES with the Naga, Khássia, and Gárro hills, and some remarks about the Iravádi.

Longitudinal from east to west: Brahmakúnd viâ Rajmahál to the Sanderbans.

In this area, many parts of which consist of wild and almost uninhabited districts, we have been able, in addition to our own observations (by Hermann and his establishment in 1855-6), to collect various materials for approximatively defining the general topography of these regions.

As the Brahmapútra and the Iravádi, the two principal rivers of this area, form at the same time its most prominent features, a descriptive sketch of their respective courses will, we hope, contribute to the completion of the general characteristics of these regions.

A. *The Brahmapútra.*

Assám, throughout its whole breadth, from the Khássia and Naga hills up to the southern foot of the Himálaya, was formerly the basin of a fresh-water lake, and is now drained by the Brahmapútra. This mighty river runs through the country from Brahmakúnd to Goalpára for a mean length, exclusive of its numerous small curves, of more than 400 miles.

The entire surface of Assám presents a gentle, uniform slope, with a few isolated granite hills, sometimes of no considerable mean elevation. The Brahmapútra nowhere presents any remarkable contraction of its bed, and the only rapid of importance is situated fifteen miles below its confluence with the Dihóng.

The level of the Brahmapútra at Sádía is 210 feet.

A little to the south of the entrance of the Tista begins that part of the river where the stream branches off in the shape of a delta, and shortly joins that of the Ganges. The ebb and flood of the tide extend, in the season when the river is low.

upwards beyond Dháka; the fall from Sádía to the delta consequently amounting to half a foot per mile.

The determination of heights for single points of the river and its environs are contained in the special register of heights. Of these may be particularly mentioned the mountains of Lákimpur, which attain an elevation of 7,000 feet.

Sádía is situated near the spot where the most considerable of its affluents join the Brahmapútra, viz. the Dihóng (a river identical with the Tibetan Zámbo), into which, before its confluence with the Brahmapútra, flows the Dibóng.

A little to the north of this point the Digáru also disembogues itself into the Brahmapútra. Of the affluents on the left bank the Noh Dihing deserves special mention.

The Brahmakúnd is a very deep basin-shaped enlargement of the river, just before it emerges from the mountains to descend into the plains of Assám.

The velocity of the current, which both above and below the Brahmakúnd is very great, suffers an unusual diminution at this point.

From here the terrain, at a short distance from the principal bed of the stream, begins to rise rapidly, and the fall of the tributaries, even down to their very junction with the main river, is very considerable. The Noh Dihing has a curious fork-shaped partition, which possesses the greater interest in proportion to its comparative proximity to the sources of the river.¹ This region in particular was explored by Hermann's assistant, Lieutenant Adams, who also determined the height of several points. In this terrain there yet remain to be mentioned the heights of Dápá Būm, on the left bank of the river, and of the Thigritáya, on the right.

For the district of the sources of the Brahmapútra we have received the very interesting manuscript map of the missionaries Krick and Boury, who, following the course of the stream, penetrated through the wild regions inhabited by the Míshmis, and passed beyond the confines of Tibet to the north-east of Sádía. Unhappily, on their second journey both of them were murdered at the settlement of Somtuán, a place situated five miles south of Sänggu (lat. N. 28° 29', Long. E. Gr. 97° 1'), the residence of one of the provincial governors of Tibet.

Their map gives the course of the upper part of the Brahmapútra, and the point of junction of its various affluents, with far greater precision than the earlier one

¹ In the valley proper of Assám such ramifications are not unusual. As the largest of these I may mention the Bégang river, north of Bishnáth, the Dhansiri, in the Kuripára duár, &c.

for the same district so carefully prepared from native sources by Lieutenant Wilcox¹ (No. 138 of the Indian Atlas).

The sources of the Brahmapútra proper may be assigned to Lat. N. $33^{\circ} - 32\frac{1}{2}^{\circ}$, and Long. E. Gr. $97^{\circ} 30'$. The first snow-covered mountains occur in Lat. N. $28\frac{3}{4}^{\circ}$. The Brahmapútra is called by the Tibetans Záyö chu, after the province Záyö,² through which it flows,³ the Míshmis and Singphos give it the name of Tálu Ka. Its direction as far as Lat. N. $27^{\circ} 55'$ is nearly due south, from the entrance of the Gálum river⁴ to the Dū river north-west, and from this point to Sádía south-west.

Determinations of heights are not in existence for the course of the river above Assám.

B. *The Nága, Khássia, and Gárro Hills.*

Along the whole length of the left shore of the Brahmapútra, and nearly parallel to the broad valley through which it runs, we meet with a longitudinal range of

¹ The discovery, that the Dihóng enters the vale of Assám, and does not, as in Klaproth's map, discharge itself into the Iravádi, seems to have been the cause of too low an estimate being assigned for the size and water volume of the Brahmapútra. The Dihóng was generally considered as properly the upper course of the Brahmapútra, although the Brahmakúnd had been repeatedly reached since 1826, by Bedford, Jones, Wilcox, Beddingfield, and Neuville. Some of them had pushed forward even considerably beyond it. Wilcox penetrated 37 miles up the stream, Griffith had been 10 miles north of the Brahmakúnd in the year 1837, and Captain Rowlett proceeded along the affluent Dū as far as Túpang, Lat. N. $28^{\circ} 23'$.

The journey of the French travellers Krick and Boury was preceded by that of the two Indian fakeers, who had pushed up the stream only a few miles farther than Wilcox, when they were murdered in the neighbourhood of the entrance of the Gálum river. Their intention was to reach, as the first, the actual sources of the Brahmapútra, an object of worship for the Hindus, since the Brahmakúnd had ceased to be regarded as such; and previous to their leaving Assám they communicated their intention to the authorities, so that some geographical communications at least, even if not very precise and well defined, might have been expected from them.

² The section of the river also which was executed, and its volume of water ascertained, by my establishment under Lieutenant Adams and Draughtsman Ábdul, at Sádía, confirmed the fact, that the Brahmapútra issues from the Záyö valley, and that in respect of volume of water, it is almost equal in size to the Dihóng. In Europe there are also many instances of the confluence of streams nearly equal in size and importance, where it would be very difficult to decide upon the name to be retained, if the direction of the valley were not allowed to determine the question.

³ The confines of Tibet on the Míshmi frontier are situated in Lat. N. $28^{\circ} 2'$. Isolated villages and stations of the Tibetans in charge of Lamas extend the whole way. These places are tributary to Lhássa,—a relation apparently analogous to that existing along the commercial road, which runs through Bhután over Narigún and Táuong.

⁴ It is characteristic of the course of mountain rivers, that important alterations in their direction very frequently coincide with the entrance of the larger affluents, and this because the same influences that affect the main valleys have exercised an equal effect upon the lateral valleys.

secondary hills, inhabited by the various scattered tribes of the Nágas, Khássias, Jáintias, and Gárros. We can present but comparatively meagre information about these mountains.

a. For the Nága hills south of Sibságer, I found, in the Assám Revenue Survey Office of Gohátti, a manuscript map by Thornton, prepared from surveys taken between the years 1839 and 1842, and which I was allowed to copy; in it were also included some heights obtained by a boiling-point thermometer. The height of the Malulhúpia pass is calculated from information obtained by my draughtsman Ábdul at Sibságer. The height of the Barél range is based upon data furnished by Major Butler. The Nága villages, like those of the Khássias, are usually situated, for the purposes of defence, on the top of dominating hills, or of minor but well protected prominences, and are surrounded by strong timber blockades. The inhabitants seem to avoid making a permanent settlement in the valleys.

b. The Khássia hills present in general the aspect of a well-defined plateau with comparatively small, isolated elevations. The plateau is terminated to the north by the valley of the Brahmapútra, to the south by that of the Súrma.

In addition to the barometrical observations, I (Hermann) made a special triangulation for the southern part of the Chérra hills, near the station of Chérra Púnji. The base line began on the east side of Mr. Inglis' house, and was continued to the second hill near the churchyard. The two points, both of which offered a very good view of the environs, were found to be 8,793 feet¹ distant from each other.

Besides the latitude, longitude, and height for Mópát peak, Mápeng summit, and Sararím peak, given below, I obtained the *distance* of the next crest, in an easterly direction from Chérra Púnji, referred to the point where it commences its steep descent to the plains. The breadth of this wide and deep depression in the southern border of the plateau was found to bear from Chérra Púnji S. 64° E., and to amount to 36,077 feet; the *mean* direction of the *crest* is from N. 8° 40' W. to S. 8° 40' E. In the few existing maps for the Khássia hills, the bearing is laid down in a northerly direction.

¹ The triangulation is laid down in one of our manuscript-maps, and the view from the southern point will form the special subject of one of the plates of our Atlas.

C. *The Iravádi.*

For the river system of the Iravádi, I (Hermann) received very important and interesting data from various officers residing in Assám; my acknowledgements being more particularly due to Colonel Hannay, Colonel Jenkins, and Major Vetch. During my stay at Dibrugárh, I was enabled to collect many of the routes taken by the Singpho tribe; but the list was greatly enlarged and completed during the excursions of my assistant,¹ Lieutenant Adams.

The main branch of the Iravádi, called the Nam Kyu, has its source in Lat. N. $27^{\circ}9'$, and in Long. E. Gr. $97^{\circ}7'$, amidst mountains, rising probably to a height of 17,000 feet. The snow limit in this district, as in the environs of the Upper Dihing, scarcely descends below 13,000 feet. The springs are reported to be fed by large snow beds and a few glaciers.

The watershed between the Dihing and the western affluents of the upper valley of the Iravádi is formed by snow-capped mountains, which, however, diminish in height towards the east. The summit of Phungalbúg, 17 miles E. of the watershed, is only 11,000 feet high.

The course of the Iravádi runs in an almost southerly direction as far as Lat. N. 27° , from whence it slightly diverges to the south-south-west. For that part of the river-district south of $25\frac{1}{2}^{\circ}$ Lat. N., we have received from Colonel Hannay an exceedingly interesting river-chart on a scale of one inch to the mile, which contains some determinations of heights, as well as of latitudes and longitudes.

The course of the Nam Keng and Iravádi presents the following characteristics:

1. At the confluence of the Nam Keng and the Nam Yang rivers (Lat. N. $25^{\circ}20'$ and Long. E. Gr. $95^{\circ}15'$) the height amounts to 1,003 feet. To the right of the confluence at this point is situated Mógung Máyo, a large settlement of the Shans.

In their upper parts above the junction, the valleys of the Nam Keng and Nam Yang form, with reference to their mutual position, one large depression of longitudinal form, varying but little in direction from that of the principal vale of the Iravádi. The same forms again appear to the west of this river, in the uppermost parts of the water district of the Khyendvén.

¹ The detail of the Singpho routes will be given in the Topical Geography, Vol. III.

From the entrance of the Nam Yang downwards, the valley of the Nam Keng is generally very flat, and of some considerable width, and numerous marshy tracts appear on either side of the river. The average length of the Nam Keng, from the mouth of the Nam Yang down to its junction with the Iravádi at Kátkyo Náinmo, including the numerous curves,¹ amounts to 52 miles.

2. The Iravádi, from the entrance of the Nam Keng to Amarapúra, has a real length of 269 miles, from Amarapúra to the head of the delta at Sakkemún, 370 miles. The delta forms a triangle, nearly equilateral, with sides of 150 miles, the enclosed area consequently amounting to 9,742 square miles.

Towards Pégu and Sitán the Iravádi widens considerably, in consequence of the accession of the Pan lan river, and its limits become less sharply defined. The entire length from the source to the sea mouth is somewhat over 1,050 miles.

3. At Kyúk Kyk Yóva, the residence of Mum Yang vun (Lat. N. $25^{\circ} 2'$, Long. E. Gr. $96^{\circ} 15'$), the height of the river is 854 feet; at Chōkī Shue mut tho phyá, two miles north of Amarapúra (Lat. N. $23^{\circ} 4'$, Long. E. Gr. $96^{\circ} 15'$), the height is 569 feet.

4. Longitudinal flats, the basins of former lakes, succeeding each other with little difference of height, but as distinct steps, and numerous narrows and rapids, form the especial characteristics of the Iravádi river bed, and essentially distinguish it from those of the Ganges and Brahmapúra. These contractions of the stream, or narrows, are called *drengs*. The last considerable one that occurs is formed by sandstone rocks, and lies only 40 miles above Amarapúra.

5. Of the mountains bordering the course of the Iravádi, the following may particularly be mentioned, although the heights ascribed to them are necessarily only approximations:

a. Upon the right bank of the Iravádi, the mountains opposite Than yun yova, in Lat. N. $24^{\circ} 36\frac{1}{2}'$, Long. E. Gr. $96^{\circ} 31\frac{1}{2}'$, have an average height of from 6,000 to 7,000 feet. One of the highest, the summit of which is visible from the valley, reaches apparently 8,000 feet.

¹ The length was measured by following the course of the river upon the map with a small wheel, that turned upon a screw with a side movement; the wheel was then drawn back in the opposite direction along a straight line, until it had reached the point of the screw from which it started, when the resulting straight line gave the measured length required.

b. Westward of Let pan zin Yóva, at a little distance from the right bank (Lat. N. $24^{\circ} 27' 2''$, Long. E. Gr. $95^{\circ} 56' 15''$), the summits of the mountains attain a height of 2,000 feet.

c. Heights of 800 and even 1,000 feet are also numerous on the right bank of the river, only 20 to 23 miles north of Shue mut tho phya (Lat. N. $23^{\circ} 4'$, Long. E. Gr. $96^{\circ} 15'$).

The character of the whole river district, including the elevations not above from 3,000 to 4,000 feet, presents a thoroughly tropical appearance.

The declivities of the hills, as well as the valley of the river, are covered with the wildest and most diversified vegetation, in the shape of dense tree and grass jungles. These jungles are sparsely populated by the almost savage tribes of Shans, Singphos, and other related races, who have made isolated and usually fortified clearings in the forests at the most unexpected places. Indeed, these clearings, where the trees have been burnt down, are the only cultivated spots of ground to be found in these parts.

Although the tribes, who are not nomadic in the usual sense of the word, remain a long time in the same places, yet circumstances, arising from the hostile disposition of the various tribes, often compel them to migrate in large numbers.

The villages on the banks of the Iravádi are much larger and the houses of a more solid construction. In the upper parts of its course are to be found single colonies of Assamese emigrants, and even far up the stream fortified Běrmese stations are met with.

I. ASSÁM, DELTA OF THE GANGES AND BRAHMAPÚTRA.

No. 1. PHUNGALBÚNG PEAK, $27^{\circ} 28'$; $97^{\circ} 15'$, in Assám, W. of the Brahmapútra.

Loc. *Top of the peak* ab. 11,000 ft. Schl., A. O.

No. 2. DÁPLA BUM PEAK, $27^{\circ} 42'$; $96^{\circ} 42'$, in Assám, the dominating peak, about 24 miles S.E. of the Brahmakúnd 14,540 ft. Schl., A. O.

This peak is also interesting with reference to the physical geography of the country in which it is situated. Its summit may be assumed as 100 feet above the snow line, a height remarkably

low for this latitude. The peak remains covered with a thin, but well marked, stratum of snow throughout the year.

Loc. *Mean height of the snow line* 14,450 ft. Schl., A. O.

NO. 3. THIGRITÁYA PEAK, $28^{\circ} 13'$; $96^{\circ} 6'$, in Bhután, a peak near the origin of the Digáru river ab. 13,500 ft. Schl., A. O.

NO. 4. BÓRI AND NOH DIHÍNG SEPARATION, $27^{\circ} 28'$; $96^{\circ} 6'$, in Assám, in the territory of the Singphos.

Loc. *Level of the separation* 1,273 ft. Schl., Herm.

6, Thermo-barom. 1856, May 24, 10^h A.M. A. $209^{\circ} 63$ Fahr., $77^{\circ} 4$. Gohátti $29^{\circ} 693$; $80^{\circ} 0$; 84. — 12.

NO. 5. SÁDIA, $27^{\circ} 49'$; $95^{\circ} 38'$, in Assám, on the right side of the Kundíl river, an affluent of the Brahmapútra near this place.

Loc. *Level of the Brahmapútra* 210 ft. Schl., Lt. A.

NO. 6. NÚNGPUNG, OR SALT WELL, $27^{\circ} 3'$; $95^{\circ} 29'$, in Assám, on the Báklu, an affluent of the Disúg.

Loc. *Level of Salt well* 1,762 ft. Schl., Lt. A.

6, Thermo-barom. 1856, March 14, 10^h A.M. A. $209^{\circ} 23$ Fahr.; $64^{\circ} 0$; 98. Gohátti $29^{\circ} 977$; $74^{\circ} 5$; 79. — 11.

NO. 7. JÁIPUR, $27^{\circ} 17'$; $95^{\circ} 21'$, in Assám, on the left side of the Bóri Dihíng.

Loc. *Mean height of the village* 1,140 ft. Schl., Lt. A.

6, Thermo-barom. 1856, May 3, 11^h 30^m A.M. A. $209^{\circ} 80$ Fahr.; $74^{\circ} 1$; 88. Gohátti $29^{\circ} 693$; $77^{\circ} 6$; 88. — 36.

NO. 8. LÁKIMPUR HILLS, $27^{\circ} 21'$; $94^{\circ} 1'$, in Assám, N. of Lákimpur, on the right side of the Brahmapútra, between the Londíri and Subansíri rivers.

Loc. 1) *Average height of the prominent peaks* ab. 7,000 ft. P. C. Bruce.

The tops of these hills are just covered with snow in winter.

Loc. 2) *Lowest snow limit in winter* 6,800 ft. P. C. Bruce.

NO. 9. TÉZPUR, $26^{\circ} 34' 6$; $92^{\circ} 46' 8$ E, in Assám, on the right side of the Brahmapútra.

Loc. 1) *Commissioner's Circuit bángalo* 278 ft. Schl., Herm.

1, Greiner. 1856, Jan. 22, 10^h A.M. A. $29^{\circ} 788$; $57^{\circ} 4$; 83. Gohátti $29^{\circ} 953$; $61^{\circ} 9$; 87. — 5 = 283

" " " 27, 10^h " " $29^{\circ} 764$; $57^{\circ} 4$; 85. " $29^{\circ} 916$; $62^{\circ} 0$; 91. — 3 = 273

Loc. 2) *Level of the Brahmapútra* 117 ft. Schl., Herm.

By trigonometric measurement; 161 ft. below the Circuit bángalo.

Loc. 3) *Top of the bank of the Brahmapútra* 199 ft. Schl., Herm.

By trigonometric measurement; 79 ft. below the Circuit bángalo.

Loc. 4) *Jail Yard* 225 ft. Schl., Herm.

By trigonometric measurement; 108 ft. above the level of the Brahmapútra.

No. 10. UDELGÚRI, $26^{\circ} 45' \cdot 7$; $91^{\circ} 56' \cdot 5$ $\overline{\text{P}}$, in Assám, province of Dárrang, at the southern end of the road from Lhássa to Assám.

II. NÁGA, KHÁSSIA, AND GÁRRO HILLS.

No. 50. SÍMA PEAK, 26° 44'; 95° 9', in the Nága hills, one of the highest points near the crest of the Nága Hills ab. 5,000 ft. Schl., A. O.

No. 51. JABOKÁ, 26° 56'; 95° 4', in the Nága hills, S.W. of Borhát, 7 miles E. of the Sáfri.

Loc. Mean height of the village 2,880 ft. Schl., A. O.

No. 52. LAKÁNA, 26° 47'; 94° 56', in the Nága hills, a village on a gently undulating plateau.

Loc. Mean height of the village 2,840 ft. Schl., A. O.

¹ The pamphlet "Guide to Places along the Railway from Howrah to Ranigánj", by Sanders, Cones, and Co., Calcutta, 1855, contains many an interesting detail, but no heights.

No. 53. JÁKTUNG PEAK, $26^{\circ} 41'$; $94^{\circ} 47'$, in the Nága hills, a marked prominence on the plateau ab. 3,900 ft. Schl., A. O.

No. 54. TÁBLUNG PEAK, $26^{\circ} 39'$; $94^{\circ} 45'$, in the Nága hills, close to the bend in the course of the Díkho river ab. 4,400 ft. Schl., A. O.

No. 55. NÁNGTA, $26^{\circ} 40'$; $94^{\circ} 38'$, in the Nága hills, the name of a fortified settlement of the Námsang Nágas.

Loc. *Mean height of the settlement* 2,810 ft. Schl., A. O.

No. 56. UPPER NÁMSANG $26^{\circ} 38'$; $94^{\circ} 37'$, in the Nága hills, a fortified settlement of the Námsang Nágas.

Loc. *Mean height of the settlement* ab. 2,500 ft. Schl., A. O.

No. 57. MALULHÚPIA PASS, $26^{\circ} 19'$; $94^{\circ} 36'$, in the Nága hills, a pass in the crest which forms the watershed between the Brahmapútra and Kuendóen ab. 5,400 ft. Schl., A. O.

No. 58. NÁMSANG, $26^{\circ} 36'$; $94^{\circ} 34'$, in the Nága hills, fortified settlements of the Námsang Nágas.

Loc. *Mean height of the settlement* 2,825 ft. Schl., A. O.

No. 59. BARÉL RANGE, 25° to $25^{\circ} 20'$; $92^{\circ} 45'$ to $93^{\circ} 15'$, in the crest of the Nága hills, S. of Naugóng.

Loc. *Mean height of the crest* 6,200 ft. Schl., A. O.

This range forms the watershed between the Dáyang river and the northern affluents of the Súрма, and is the political boundary between Kachár Proper and northern Kachár, a territory annexed in 1854.

No. 60. KADHÁTI HILL, $25^{\circ} 7'$; $92^{\circ} 15'$, in the Jáintia hills, about 10 miles N. of the Súрма. 2,697 ft. Oldh.

No. 61. ROMBÁI, $25^{\circ} 18'$; $92^{\circ} 11'$, in the Jáintia hills, a village between Juvái and Lakadóng. 3,578 ft. Oldh.

No. 62. LAKADÓNG, $25^{\circ} 12'$; $92^{\circ} 11'$, in the Jáintia hills, N.N.W. of Kadháti hill.

Loc. *Undefined* 2,294 ft. Oldh.

No. 63. NÁRTIANG, $25^{\circ} 33'$; $92^{\circ} 10'$, in the Jáintia hills, about 9 miles N. of Juvái.

Loc. *Mean height of the village* 4,178 ft. Hook.

No. 64. MUSHÁI, $25^{\circ} 28'$; $92^{\circ} 3'$, in the Khássia hills, E.S.E. of Chállong peak.

Loc. *Undefined* 3,411 ft. Oldh.

" " 4,863 „ Hook.

No. 65. PÓMRONG, $25^{\circ} 30'$; $91^{\circ} 57'$, in the Khássia hills, E. of Nonkrím.

Loc. 1) *Undefined*. 4,748 ft. Oldh.

" 2) " 5,143 „ Hook.

" 3) *Kalapáni ridge to the south* ab. 5,300 „ Oldh.

No. 66. NONKRÍM, $25^{\circ} 30'$; $91^{\circ} 50'$, in the Khássia hills, N. of Chérra Púnji.

Loc. *Undefined* 5,406 ft. Oldh.

" " 5,601 „ Hook.

No. 67. MÓPAT PEAK, $25^{\circ} 18' \cdot 1$; $91^{\circ} 48' \cdot 2$, in the Khássia hills, in the range N.E. of Chérra Púnji 6,694 ft. Schl., Herm.

Trigonometrically measured from Chérra Púnji (see p. 98).

No. 68. LAILANGKÓT, $25^{\circ} 28'$; $91^{\circ} 48'$, in the Khássia hills, S. of Nankrín.

Loc. *Undefined* 5,703 ft. Oldh.

No. 69. CHÁLLONG PEAK, $25^{\circ} 32'$; $91^{\circ} 48'$, in the Khássia hills, about 8 miles N.E. of Mófiong 6,662 ft. Hook. 6,124 ft. Oldh.

No. 70. MAURINGRÍN, $25^{\circ} 30'$; $91^{\circ} 43'$, in the Khássia hills, a stone bench on the ridge N. of Chérra Púnji.

Loc. *Level of the stones* 4,823 ft. Oldh.

No. 71. MÓPLANG, OR MÓFLONG, $25^{\circ} 28'$; $91^{\circ} 43'$, in the Khássia hills, about 15 miles N. of the sanitarium of Chérra Púnji.

Loc. *Dak bángalo* 6,078 ff. Schl., Herm.

" *ditto* 6,062 „ Hook.

1, Greiner. 1855, Nov. 10, 6^h A.M. A. 24 201; 48 9; 94. Calcutta 29 929; 76·5; 88 1 60

NO. 72. MAHADÉO, $25^{\circ} 12'$; $91^{\circ} 42'$, in the Khássia hills, 2 miles N.E. of Báirong.

Loc. 1) *Guard house* 2,188 ft. Oldh.
 „ 2) *Top of a hill (Mahadéo rock)* 2,623 „ Oldh.

NO. 73. TÉRIA GHAT, $25^{\circ} 11'$; $91^{\circ} 42'$, in the Khássia hills, on the southern foot of the Khássia hills.

Loc. 1) *Undefined* 128 ft. Oldh.
 „ 2) *Level of fossil beds above Téria Ghat* 352 „ Oldh.
 „ 3) *Bottom of zig-zags, on road to Téria Ghat* 1,428 „ Oldh.
 „ 4) *Level ground below locality 3, sandstone abounding in shells* 750 „ Oldh.

NO. 74. MÓPEA, $25^{\circ} 48'$; $91^{\circ} 42'$, in the Khássia hills, N.E. of Nankláu.

Loc. *Level of Bor páni* 2,528 ft. Schl., Herm.

1, Greiner. 1855, Nov. 14, 9^h A.M. A. 27 434; 53 1; 82. Calcutta 29 985; 73·3; 76.

NO. 75. KALAPÁNI, $25^{\circ} 23'$; $91^{\circ} 41'$, in the Khássia hills, a bángalo N. of Chérra Púnji.

Loc. 1) *Bángalo* 5,302 ft. Hook.
 „ 2) *Kalapáni bridge* 3,179 „ Oldh.·

NO. 76. TANGVÁI, $25^{\circ} 11'$; $91^{\circ} 41'$, in the Khássia hills, at the southern foot of the Khássia hills 210 ft. Oldh.

NO. 77. MÁPENG PEAK, $25^{\circ} 16' \cdot 8$; $91^{\circ} 40' \cdot 9 \overline{P}$, in the Khássia hills, a marked prominence in this ridge 5,279 ft. Schl., Herm.

Trigonometrically measured from Chérra Púnji (see p. 98).

NO. 78. CHÉRRÁ PÚNJI, $25^{\circ} 14' \cdot 2$; $91^{\circ} 40' \cdot 5 \overline{P}$, in the Khássia hills, a sanitarium.

Loc. 1) *Late Capt. Byng's bángalo* 4,125 ft. Schl., Lt. A.

AREA II.

HINDOSTÁN ALONG THE GANGES.

Longitudinal from west to east: Saháranpur viâ Khánpur to Rajmahál.

The plain of the Ganges, or Hindostán Proper, occupies the principal part of this area. This plain, one of the largest and most fertile of India, has a remarkably uniform and gentle slope, even not interrupted by isolated rocky hills, as we meet them in the Brahmapútra valley.

To the north, Area II. is bounded by a longitudinal zone of hills of tertiary rocks at the foot of the Himálaya; the southern limits we have defined by the Bétva and Jámma rivers; in the western part, and in the eastern by the watershed of Bahár.

The great number of points accurately defined will be sufficient, without further explanation, to give an exact tableau of this extensive area.

No. 1. SAMÁNA, $29^{\circ} 53'$; $76^{\circ} 56'$, in Hindostán, N. of Kárnál 934 ft. Ger.

No. 2. GHARÁNDA, $29^{\circ} 32'$; $76^{\circ} 58'$, in Hindostán, 10 miles S. of Kárnál. 945 ft. Ger.

No. 3. KĀRNÁL, $29^{\circ} 42' \cdot 3$; $76^{\circ} 58' \cdot 3 \frac{1}{2}$, in Hindostán, a large station 6 miles W. of the Jámma. •

Loc. *Mean height of the cantonment* 966 ft. Ger.

No. 4. PANIPÁT, $29^{\circ} 23'$; $76^{\circ} 59'$, in Hindostán, 78 miles N. of Déhli . 936 ft. Ger.

No. 5. SAMBHÁLKA, $29^{\circ} 13'$; $77^{\circ} 1'$, in Hindostán, 6 miles W. of the Jámma.

AREA III.

PĀNJĀB TO GUJRĀT.

Meridional from north to south: Ātak viâ Mithānkōt to Dīū.

With reference to its general hypsometric character, this area may be divided into two parts, the one to the west, and the other to the east of the Indus. Westward of the Indus we meet a complicated chain of mountains—the Suféd Koh, a continuation of the Sólíman range—which runs nearly parallel to the course of the Indus. Its highest peak, the Suféd Kōh, in Lat. N. $33^{\circ} 58' \cdot 1$, Long. E. Gr. $70^{\circ} 27' \cdot 9$, attains a height of 14,839 feet.

A great number of interesting points in the eastern parts of the Sólíman range were determined by Lieutenant Walker (see p. 6), and by Adolphe.

The most remarkable feature east of the Indus are the *duábs*, formed by the various affluents of the Indus. They have so uniform a slope, that comparatively few heights are sufficient to define the general inclination of their course. Greater elevations are to be found only in the Salt Range, for which, in addition to our own observations, we have a considerable number of approximations by Dr. Fleming (see p. 5).

Sindh, the southern part of the area, is to some extent included in the delta of the Indus, and even the higher parts more to the north, are elevated but very little above the level of the sea.

Kāch is a hilly country, separated from Gujrāt by the Rān, or salt-moor, in connection with the gulf of Kāch. The remarkable depressions of the Rān, which have been caused by earthquakes, partly in historical times, present a flat surface, for the most part dry in summer, but covered with brackish water after the rains and spring-tides.

No. 1. PESHÁUR, $34^{\circ} 3' 2''$; $71^{\circ} 33' 3''$, in the Pānjāb, a large frontier station, W. of the Indus.

AREA IV.

CENTRAL INDIA.

Meridional, from north to south: from the Ganges viâ Nâgpur and Chânda to Kôringa.

The principal portion of this extensive area is occupied by the Vindhya and Satpûra range and the entire river system of the Godâveri. With the exception of a few isolated, well-defined crests of some extent, its characteristic features are the plateaux.

Amarkântak, the most important of them, forms the watershed of the Mahanâdi, Sôn, Tons, Johilla, and Nârbâda. The rivers, though large and full of water even half way from their mouth, are very irregular in the slopes of their beds, and are disturbed by frequent rapids, so that owing to these impediments, increased still further by the rocky character of the river beds or their banks, navigation is limited for the most part to the lower portions of their course.

For all the central parts of this area, the height of the land varies but little, even the valleys being on an average above 1,500 feet. But notwithstanding the generally high elevation of the district, its central position makes it a zone of maximum heat; and indeed, during the time of summer it belongs to the hottest regions of India, even of the globe.

No. 1. SANÍCHRI, $26^{\circ} 23' \cdot 5$; $78^{\circ} 12' \cdot 1$ $\frac{1}{2}$, in Bândelkhând, N. of Gvâhor.

AREA V.

DÉKHAN AND MAISSÚR.

* Diagonal, from north-west to south-east: Bombay viâ Púna and Bellári to Madras.

The general character of the area is mountainous, including as it does the principal elevations of the Dékhan and a great part of Maissúr. The only low country is on its eastern border, where a broad belt of alluvial soil runs along the Karimánal (Koromándel) coast, forming one of the richest districts of India. To the west the *Ghâts* constitute the principal feature, and present a range of mountains rising abruptly above the Kónkan, with a very steep western slope, and sending out many spurs and plateaux towards the Dékhan. This range is intersected by several passes, or ghâts, of which the Bhôr ghat and the Tal ghât (see p. 195) must be mentioned as the most remarkable. A railway, connecting Púna with Bombay, leads over the Bhôr ghât.

The principal river of this area is the Kríshna, which takes its rise near the Mahabaléshvar plateau, at a height of 4,110 feet. The highest peak in the Dékhan, the Kalsubái, attains a height of 5,410 feet (see p. 195).

No. 1. ASSÍRI, $19^{\circ} 42'$; $72^{\circ} 44'$, in the Kónkan, 18 miles N.E. of Mahím.

Loc. *Fort on the island* 1,713 ft. Bomb. Cal.

No. 2. BASSÍS, $19^{\circ} 2'$; $72^{\circ} 49'$, in the Kónkan, N. of Bombay.

Loc. *Top of the church* 509 ft. Bomb. Cal.

No. 3. BOMBAY, $18^{\circ} 53' \cdot 5$; $72^{\circ} 49' \cdot 1 \frac{1}{2}$ (referred to the Observatory), in the Kónkan.

Loc. 1) *Cistern of the barometer at the Government Observatory* 38 ft. Fergusson.

„ 2) *Top of the spire of St. Thomas's Church* 168 „ Bomb. Cal.

- Loc. 3) *Top of the spire of the light-house* 148 ft. Bomb. Cal.
 „ 4) *Top of the dome of the light-house* 141 „ Bomb. Cal.

The height of several points of the island (loc. 5 to 8) was determined with the aneroid by Adolphe, in Nov., 1854.

Loc. 5) *Top of the hill, S. of Vórli point. A Mohamedan mosque is erected upon it* 132 ft. Schl., Ad.

Loc. 6) *Top of the hill, S. of the sluices, near Lore Grove. Vórli range* 117 „ Schl., Ad.

Loc. 7) *Top of Málabar hill* 144 „ Schl., Ad.

„ 8) *Top of Mazagón hill* 61 „ Schl., Ad.

NO. 4. BARÚR, $20^{\circ} 5'$; $72^{\circ} 51'$, in the Kónkan, near the sea shore, 10 miles N.E. of Dhánu.

Loc. *Top of the hill* 1,761 ft. Bomb. Cal.

NO. 5. ÚRAN, $18^{\circ} 54' 0''$; $72^{\circ} 54' 7''$, in the Kónkan, E. of Bombay.

Loc. *Pagoda* 697 ft. Bomb. Cal.

NO. 6. TROMBAY, $19^{\circ} 2'$; $72^{\circ} 56'$, in the Kónkan, N. of Bombay.

Loc. *Top of a hill, W. of Trombay* 1,001 ft. Bomb. Cal.

NO. 7. TÁKMĀK, $19^{\circ} 35'$; $72^{\circ} 56'$, in the Kónkan, 7 miles S.W. of Góra.

Loc. *Hill fort* 2,616 ft. Bomb. Cal.

NO. 8. KAMANDRÚG, $19^{\circ} 24'$; $72^{\circ} 58'$, in the Kónkan, 10 miles E. of Bassín.

Loc. *Hill fort* 2,160 ft. Bomb. Cal.

NO. 9. THÁNAH, OR TÁNNA, $19^{\circ} 12'$; $72^{\circ} 59'$, in the Kónkan, N. of Bombay.

Loc. 1) *Top of the church spire* 106 ft. Bomb. Cal.

„ 2) *Hill, 3 miles E. of Thánah* 1,369 „ Bomb. Cal.

„ 3) *Hill at Kólva, near Thánah* 973 „ Bomb. Cal.

NO. 10. KĀRNÁLA, $18^{\circ} 53'$; $73^{\circ} 8'$, in the Kónkan, 7 miles S. of Panvél.

Loc. *Fort on the Funnel hill* 1,552 ft. Bomb. Cal.

NO. 11. KAILÁS HILL, $18^{\circ} 18'$; $73^{\circ} 9'$, in the Kónkan, 16 miles W. of Indapur.

Loc. *Top of the hill* 2,019 ft. Bomb. Cal.

NO. 12. MÉRA, $18^{\circ} 41'$; $73^{\circ} 10'$, in the Kónkan, N. of Nagathána, or Nagótña.

Loc. *Hill Station* 1,860 ft. Bomb. Cal.

NO. 13. BHĀU MÁLLANG, $19^{\circ} 6'$; $73^{\circ} 12'$, in the Kónkan, a hill 10 miles N.E. of Panvél.

Loc. *Top of the hill* 2,650 ft. Bomb. Cal.

NO. 14. JINKÓR, $18^{\circ} 56'$; $73^{\circ} 14'$, in the Kónkan, 2 miles N. of Chok.

Loc. *Fort* 2,065 ft. Bomb. Cal.

NO. 15. PRÁBHĀL, $18^{\circ} 58'$; $73^{\circ} 14'$, in the Kónkan, 5 miles N. of Chok.

Loc. *Fort* 2,320 ft. Bomb. Cal.

NO. 16. CHÖK, $18^{\circ} 54'$; $73^{\circ} 15'$, in the Kónkan, a small village, E. of Bombay, on an affluent of the Megáuni nálah.

Loc. *Dak bāngalo* 172 ft. Schl., Rob.

3, Oertling. 1855, Jan. 1, 3^h p.m. 29 706; 88 0. Bombay 29 847; 85 0. — 6 ft.

AREA VI.

KARNÁTIK AND NÍLGIRIS, WITH AN APPENDIX ON CEYLON.

Longitudinal, from west to east: Madras viâ Bángalur and Utakamánd to Kalikát.

This area comprises the southern provinces of the Indian peninsula, and so completes (with Ceylon as an appendix) the hypsometry of India Proper. At the southern extremity of the area, the Nílgiris, and the various ranges of the Kúnda, Sispára, and Koterghérri, are the mountain systems of greatest absolute elevation in India Proper, and, exceeding as they do at several points 8,000 feet, are particularly well defined and strikingly prominent, on account of their comparatively short distance from the sea shore on either coast of the peninsula.

The Eastern Ghâts are not properly a ridge, though the natives so call the first step, which is met with to the west of the Karimánal (Koromándel) coast.

The mountain system of Ceylon has a pretty well defined position in the centre of the island. The Píduru tálla gálle, its highest peak, attains an elevation of 8,305 feet.

No. 1. PERAMBÁK, $12^{\circ} 53' \cdot 1$; $80^{\circ} 10' \cdot 9$ $\frac{1}{2}$, in the Karnátik, 15 miles W. of the sea.

APPENDIX TO PART II.

By a careful revision of the materials, we found, in addition to the preceding, the heights of the following places, which we add to their respective Areas.

AREA I.

No. 93. GRI PEAK, $28^{\circ} 11'$; $96^{\circ} 40'$, in the Mishmi territory.

Loc. *Top of the peak* ab. 15,300 ft. Schl., A. O.

A route from the Du river to the Záyo valley, but even in summer only travelled exceptionally by the Gri-Mishmi's, passes the snow beds on its south-western slope.

No. 94. MÄNGELDÄI, $26^{\circ} 24'$; $92^{\circ} 1'$, in Assám 155 ft. Schl., Herm.

AREA II.

No. 295. GURGÄÜ, $28^{\circ} 28'$; $77^{\circ} 3'$, in Hindostán, 18 miles S.W. of Déhli.

Loc. *Mean height of the town* 817 ft. Thorn.

No. 296. MURADABÁD, $28^{\circ} 49'$; $78^{\circ} 56'$, in Hindostán, a large station on the right bank of the Rangánga, near the southern foot of the Himálaya . . . 673 ft. Thorn.

SIR PROBY CAUTLEY'S "Report on the Ganges Canal Works" (3 Vols. Text, with an Atlas of 76 plans and maps), printed in 1860 for private distribution only, contains a number of places, the relative height of which he had occasion to determine by careful levellings along the various lines of the Ganges Canal. His zero-point was the Máipur regulator, near Hardvár, at the head of the Canal, and the spot most nearly coinciding with our own determinations is the Rúrki bridge. From a private communication, kindly received from Sir Proby Cautley himself, the bed-flooring of the Rúrki bridge may be assumed as 43 feet below the entrance of the Rúrki Thomason College. The absolute height of this college, according to our observations¹, being 997 ft., that of the Rúrki bridge consequently is 954 ft., viz. (997 ft. — 43 ft. = 954 ft.) The difference of level between the Máipur regulator and the Rúrki bridge is 61 ft.; therefore, the absolute height of Máipur — zero-point, 1,015 ft. The zero-point thus fixed, the heights can be given in absolute values for all the levels contained in plates X., XI., and XII. of Sir Proby Cautley's Atlas.

We present, however, the principal places only, the difference of height between the intermediate, or secondary stations being extremely small.

PRINCIPAL LEVELS ALONG THE VARIOUS LINES OF THE GANGES CANAL.

The levels refer to the bed-floorings of all works.

No. 134. NARAIŦĠÁRH, $30^{\circ} 28'$; $77^{\circ} 7'$, in Hindostān, N.E. of Ambāla, and N.W. of Sidāura.

Loc. *Mean height of the village* 2,154 ft. Herb. and Hodgs.

No. 135. SÁPAR, $30^{\circ} 17'$; $77^{\circ} 18'$, in Hindostān, between Sahāranpur and Nahān.

Loc. *Mean height of the village*. 1,228 ft. Herb. and Hodgs.

PART III.

HEIGHTS DETERMINED IN THE HIMÁLAYA.

PANORAMAS AND PROFILES IN REFERENCE TO HYPSONOMETRY.

An enumeration of the hypsometrical materials which we found it possible to combine with our own observations, together with the general arrangement in reference to High Asia, has been given in the introductory pages of this volume.

Here we merely add a few details about the numerous drawings of Hermann and Adolphe, which relate more especially to this and the following parts.

As we have already had occasion to mention in our first volume (p. 9), this collection consists in all of 750 views and panoramas, chiefly aquarells by Hermann and Adolphe, and including photographs of landscapes by Robert. Immediately after our return from India we arranged them in 20 groups, to which one more was subsequently added, containing the latest drawings of our poor brother Adolphe, which had been recovered through the unremitting exertions of various Indian Officers.

The groups are:

A. INDIA.

- | | |
|--|--------------------------------|
| 1. Panoramic views. | 5. Central India. |
| 2. Kónkan and Western Dékhan. | 6. Eastern Ghats and Karnátik. |
| 3. Bengál to the Pánjáb. | 7. Maissúr and Nilgiris. |
| 4. Khássia hills and surrounding plains. | 8. Rivers. |

B. INDIA AND HIGH ASIA.

- | | |
|--|--|
| 9. Trees and groups of vegetation. | 10. Temples, monumental buildings, European residencies. |
| 11. Native buildings, bridges, villages, &c. | |

C. HIGH ASIA.

- | | |
|---|---|
| 12. Panoramas from the Himálaya, Tibet,
and Turkistán. | 16. Western Tibet and Karakorúm. |
| 13. Eastern Himálaya. | 17. From Ladák, across the Karakorúm and
Kuenlúen, to Turkistán. |
| 14. Western Himálaya. | 18. Salt lakes and thermal springs. |
| 15. Gnári Khórsum, Central Tibet. | 19. Snowpeaks and glaciers. |

D. OVERLAND ROUTE FROM INDIA TO EUROPE.

20. Indian Ocean to Egypt, the Mediterranean and Atlantic.

21. Last drawings of Adolphe.
- ¹

The panoramas from the Himálaya, Tibet, and Turkistán (Group 12) were all taken from points commanding an extensive view, and have been used by us for various scientific purposes. Occasionally, drawings of the same range of mountains being made from different points of known position, they approximate, as it were, to a stereoscopic completeness of outline, thus allowing of the insertion in the maps of many more points than could be fixed by triangulation.

We have often been disappointed, even after ascending to considerable heights, by the character of the views to be found. These occasional drawbacks, however, were not of serious importance, as the number of points ascended, placed at our disposal a collection of views quite large enough for us to select a nearly uninterrupted south-east north-westerly succession of the snowy ranges for the entire Himálaya, as well as for some of the countries to the north of it. In general, the best geographical views could be seen from heights between 8,000 and 13,000 feet.

CHARACTERISTICS OF THE HIMÁLAYA COMPARED WITH THE ALPS.

In the Alps a similar combination, including all the principal ranges, would be still more difficult; and this, notwithstanding their small extent as compared with the Himálaya, which from Assám to Kashmír has a length equal to the distance between

¹ Though the 80 views and panoramas accompanying this work are most carefully selected, yet we cannot but remain impressed with the lively desire to make the entire series generally known. After numerous experiments, it appeared to us that photography, combined with colour-printing, was the method best adapted for the end in view. From the great number composing the entire series, however, and especially from the circumstance that such tinted photographs would be deprived of much of their value, if not rigorously reproduced as facsimiles, though on a reduced scale, we are afraid that the proposed edition must be limited to a small number of copies. A few proofs have already been sent to India, and there, as in England, they have been received with unusual interest. (See "Journal of the Asiatic Society of Bengál," 1860, No. 1, p. 73.)

Greece and Spain. Even where, in the Alps, an unusual extent of snowy peaks is contained in one panorama (as, for instance, the view from Piz Languard, in the Engadin), the principal groups of snowy ranges are generally separated by wide intervals, and the difference of height between the loftiest peaks and the deepest parts of the valleys in sight is not to be compared with the respective scenery in the Himálaya.

Another superiority lies in the atmospheric conditions of the Himálaya, which are much more favourable than those of the Alps. The regularity of the different seasons offers the greatest probability of uninterrupted fine weather for many months, and even during the rainy season the same may often be said of the diurnal period in the Eastern Himálaya. When Hermann was staying in this part of the country during the height of the rains, he found the view was nearly always clear and fine in the earliest hours of the morning.

EMPLOYMENT OF SCALES IN DRAWING THE PANORAMAS.

In drawing these panoramas, a unity of linear measure was made to correspond to a constant value of angular measure. As we used a cyclic projection, the scale was necessarily the same for both horizontal and vertical angles throughout the picture.

As many of the peaks were very distant, they presented themselves under small angles, and the scale adopted had therefore to be taken rather large, in order not to exclude the lesser details, which were generally of great importance in the case of minute or distant objects.

As a rule the scale adopted was:

1 or 2 centimetres = 1° , making the circumference of $180^\circ = 1.8$ or 3.6 metres
(= 5.9 or 11.8 feet) in length.

The immediate combination of our measurements with the drawings had the great advantage of accelerating, even in the large scale used, the correct laying down of the outlines, of more accurately defining the individual character of each object, and, amongst other consequences, of giving as immediate result the correct inclination of the mountains, naturally modified at the same time by the known rules of perspective.¹

¹ We postpone details of the inclinations, and their connection with various geological questions, the effects of erosion, glacial phenomena, &c., to the Vol. of Geology.

Our drawing paper was always prepared beforehand, the several sheets being pasted together, and mounted on cloth. It was then carried as a roll, and the size required cut off upon the spot.¹

As not hours only, but days were consumed in drawing and painting a panorama of large size, we had to exercise great care in keeping the illumination uniform for the entire extent. It is a natural consequence of the cyclic projection employed, that the shadows cannot remain parallel to the eye throughout; they show, on the contrary, a radial divergency. At first the effect may be rather strange; but any unnatural expression at once disappears, if the sheet be bent in a curve corresponding to so much of the circumference of a circle as is represented by the number of degrees included in the panorama. Such a position, demanded as it is by the principles employed in the mode of drawing here adopted, is naturally the one most favourable for reproducing the correct impression.

PANORAMIC PROFILES.

Our Atlas of panoramas and views contains some of the larger panoramas in oil-print. In our selection we have chiefly produced those which were most characteristic for the different modifications of scenery. Some of the panoramas, which included, at the same time, the greatest number of geographical details, have been reduced and formed into a collection of *Panoramic Profiles*, to be added to the present volume, and we may hope, perhaps, that their combination, hitherto a novelty of the kind, will prove useful in completing the orographical tableau of the Himálaya and Tibet.

In order to deviate as little as possible from the original size, we generally selected for representation in profile that part of the panorama only which contained the snowy ranges; the reduction used is consequently variable, but a scale has been added for each of them. In the *oil-prints*, however, the entire view is given.

In the profiles, the principal objects, the snowy peaks, are reproduced in full detail and with their various modifications of form. In the middle ground, as far as we found it necessary for completing the general geographical character of the picture, we distinguish distances by modifications of shading.

¹ At first we tried the Watman paper in loose sheets, but it did not take long to fully appreciate the inconvenience of using unmounted paper, and of pasting together on the road the single pieces for the length required.

DIAGRAMS ADDED TO THE PANORAMIC PROFILES.

A plan of *geographical positions* is added to each plate, combining two panoramas on the scale of 32 miles to the inch.

Care has been taken to make the central meridional line vertical, but the variation arising from the geographical network of latitude and longitude occasions some differences between the angles of bearings in nature and those on the plan, though indeed they are not important, and chiefly occur in the lateral parts. In the centre another little difficulty has arisen, modifying the *absolute* coincidence of the bearings in the plan with those on the panorama. It was found impossible to avoid an occasional slight change of the eye-station when drawing, in order to obtain the most favourable conditions for a foreground, the position of a theodolite which only needs perfect freedom in every direction, not always coinciding with the eye-station necessary for a drawing. However, with a little management, the differences have been reduced, so as to be hardly appreciable. To peaks not visible from the eye-station no line of bearing is drawn.

Two *hypsonometrical diagrams* are inserted on either side of the plan. The peaks follow each other in the order of their longitude, differences of latitude altogether disappearing on this projection. In these diagrams, peaks not visible from the eye-station are distinguished by dotted lines. The vertical scale is 1 to 60,000, or 5,000 ft. to the inch, the levels not commencing before 10,000 ft., in consequence of the employment of so large a scale.

Where the succession of the peaks was chiefly longitudinal (from east to west), we retained the scale of 32 miles to the inch, but in cases where the general succession was more diagonal, we employed a larger scale for the differences of longitude, in order to avoid an unnecessary crowding of heights within a small space.

DESIGNATION OF PEAKS.

We must also draw attention to a circumstance already alluded to, pp. 66 and 67 of this volume, where we explained the method of nomenclature adopted in distinguishing the different peaks. The necessity of finding proper names for the various objects is not only of importance for trigonometrical operations in general, but also for every geographical detail. In most cases little difficulty was experienced, and

more especially so when the peak was an isolated one. For larger groups, we could not do better than add the sign adopted by the Great Trigonometrical Survey to the name of the group which we have adopted.

In such cases we write thus:

SANKÓSI PEAK No. xvii. †

Sankósi is the name employed by us for several peaks of the same group (see Area VII. Nos. 199 to 203). Peak No. xvii. † is the designation given to this particular peak by the G. T. S. As the latitude and longitude for each peak is added, we consider it unnecessary to give as well the *series* of the G. T. S. to which this number or sign is referred.

Also in cases where the peak has a well defined and known name, we add in brackets the sign or number with which it is designated by the G. T. S.

For peaks measured by previous observers independently of each other, especially for those of Kāmáon and Gārhyál, a careful revision and examination of existing materials enabled us in most cases to identify them, and to each peak will be found attached the observer's mark and the values of the geographical co-ordinates as obtained by him.

AREA VII.

HIMÁLAYA OF BHUTÁN, SÍKKIM, AND NEPÁL.

Longitudinal, from east to west: from Bhután in the direction of Darjiling, to the western border of Nepál.

This area begins in the longitude of the upper end of the Assám valley, and being continued to the left bank of the Káli-Sárju, or Ghógra river, it consequently includes Bhután, Sikkim, and Nepál, as well as the few isolated heights hitherto measured to the north of the eastern Himálaya.

By far the greater number of the loftiest peaks as yet determined are situated within these regions. Although Turner's visit to Bhután in 1783 had called general attention to the existence of heights till then unrivalled, it was only in 1816 that Colebroke, then President of the Asiatic Society of Bengál, could consider himself authorized "to make an unreserved declaration of the opinion, that the Himálaya is the loftiest range of Alpine mountains which has been yet noticed, its most elevated peaks greatly exceeding the highest of the Andes."¹

More recently, owing to the rapid progress of the G. T. S. under Sir A. Waugh, many valuable determinations have been furnished for the Himálaya, and considerable additions made to our knowledge of its eastern regions by the special labours of Campbell, Hodgson, and Sherwill, and more particularly by the well known work of Hooker.

In our division of the countries to be respectively examined by us, the eastern Himálaya was allotted to Hermann. Both in Sikkim and Nepál many unexpected difficulties, mostly of a political nature, frequently limited my choice of routes,² and

¹ Asiatic Researches, 1816, Vol. 12, p. 252. ² See Vol. I., p. 16.

naturally reduced the number of barometrical determinations. I was, however, fortunate in finding many very favourable points for trigonometrical operations.

In *Sikkim*, during a stay of two months on the Singhalíla ridge, at an average height of about 12,000 feet, I had the opportunity of seeing the summits of mountains exceeding 28,000 feet; they were only some thirty miles distant, and the grandeur of their appearance corresponded with the stupendous altitude of the snow clad peaks. I could also look down into the valleys of the Támbar, Máí, Rängít, and Tísta, upon places of only 1,500 to 1,800 feet of absolute height. With respect to the topographical terminology of these parts, I had tolerably good reason for relying upon the information of my native companions, and particularly of the Lépchas.¹

I may here allude to the "Map of equi-distant horizontal contour lines" in the geographical part of our Atlas. The lines of this map are given in horizontal sections from 500 to 500 feet. As communicated in my official "Report No. 3, on the progress of the Magnetic Survey of India," Calcutta, 1856, the original is made on the scale of three inches to two miles, or in the proportion of 1 to 42,240; and in its construction I used a portable levelling instrument, consisting of a divided wheel and diopter. With these measurements were combined the determination of inclination of slopes by a very delicate clinometer.

The latter process being of material assistance, in cases where the point to be determined is not easily accessible (from want of roads, and more especially from the obstacles offered by the luxuriant vegetation), I may, perhaps, explain in a few words the method of deducing from the inclinations the form of the lines required.

The horizontal projection (P) of an unity of vertical height (500 feet in the present case) varies with the inclination of the surface (μ), being the cotangent of the angle of inclination, multiplied by the height taken as standard ($P = \cotan \mu \times 500$).

Beginning therefore at a point, the height of which is known and coincides with an exact multiple of 500 feet, the projection in the map of the next point, 500 feet higher, can be deduced from the formula above mentioned.

The following table which I have calculated contains, in decimals of an inch, from 10 to 10 degrees, the values of P , reduced to the proportion of 1 to 42,240.

¹ I had with me natives from a great variety of tribes, Górkhas, Kerántis, and Neváris from Nepál, and Límbus, Lépchas, and Bhútias from Sikkim, besides my Indian establishment.

Inclination = μ	log cotan μ	Horizontal distance of two
		contour lines in the map.
		Inches
10	0.7537	0.806
20	0.4389	0.390
30	0.2386	0.246
40	0.0762	0.169
50	9.9238	0.119

The points with which the steps from 500 to 500 feet coincided being found on the different slopes, their combination gives the equi-distant contour lines as immediate result.

In *Nepál*, after having obtained the official permission to visit it with my assistant and scientific apparatus, I met with a very kind reception, and through Colonel Ramsay's diplomatic exertions was enabled to procure much valuable geographical information, some of which was even supplied to me by the Maharajah Jhāng Bahádur himself. The latter assisted me more particularly in well defining the peaks, and furnished me with some rudely executed, but very interesting native maps.

I may still mention, as not altogether without importance, that by the results obtained from many of my Nepalese stations, I was able directly to connect my measurements and drawings with peaks and points also measured and drawn by me in Sikkim.

NO. 1. EASTERN DAL-LA, $27^{\circ} 52' 1''$; $92^{\circ} 38' 6''$, in Bhután, in the immediate vicinity of the Giants' peak.

Loc. *Top of the peak* 21,435 ft. Schl. Herm
 " *ditto* 21,476 " Pemb

The Giants' peak and the Eastern Dal-la are the peaks occasionally mentioned to me under the name "Gemini" by residents of Assám who had seen the Himálaya panorama from Naukláu in the Khássa hills. Schl., Herm.

NO. 2. DAL-LA, OR GIANTS' PEAK, $27^{\circ} 50'$; $92^{\circ} 34'$, in Bhután, N. of Táuong.

Loc. *Top of the peak* 22,495 ft. Schl., Herm
 Trigonometrically measured from Gohátti.

This peak is the prominent feature in the Himálaya panorama of Central Assám. The name "Giants' Peak" is the one adopted by the English residents in Assám. It is called "Dal-la" on a native Bhútia map from Táuong to Lhássa, which we have in our possession. The height of 21,600 ft. given by Pemberton, seems to refer to this peak. Schl., Herm.

NO. 3. THÉME-RI PEAK, $27^{\circ} 48' \cdot 7$; $92^{\circ} 28' \cdot 5$ P, in Bhután, W. of the Giants' peak.

Loc. *Top of the peak* 20,480 ft. Schl., Herm.

Trigonometrically measured from Gohátti.

Though I could not obtain a positive name for this peak from the natives, the designation adopted seemed to me, nevertheless, pretty well to define it. Schl., Herm.

NO. 4. PASHNÁI GHAT, $26^{\circ} 42'$; $92^{\circ} 24'$, in the Bhután-Tarái, E. of the village Órang.

Loc. 1) *Mean height of the plain at the outlet of the river from*

the Taráí. 220 ft. Schl., Herm.

1, Greiner. 1856, Jan. 20, 6^h P.M. A. $29^{\circ} 8' 30$; $68^{\circ} 9$. Gohátti $29^{\circ} 9' 81$; $65^{\circ} 2$.

.. 2) *Level of the Pashnáí* 214 ft. Schl., Herm.

NO. 5. OÁMLA PEAK, $27^{\circ} 36'$; $92^{\circ} 7'$, in Bhután, N.E. of Táuoug.

Loc. *Top of the peak* 22,430 ft. Schl., Herm.

This peak, measured from Tezpur, is also mentioned on our native Bhútia map as a prominent object on the road from Táuoug to Lhássa. Schl., Herm.

NO. 6. CHÓMO-LA MOUNTAIN, $26^{\circ} 56'$; $92^{\circ} 7'$, in Bhután, $2\frac{1}{2}$ miles distant from Nārigún, on the left side of the road descending from Táuoug. 8,105 ft. Schl., Herm.

Trigonometrically measured from Nārigún.

NO. 7. NĀRIGÚN, $26^{\circ} 53' \cdot 8$; $92^{\circ} 6' \cdot 0$ P, in Bhután, an important place, the residency of a Láma governor, on the Lhássa road viâ Táuoug.

Loc. 1) *Base of the large prayer wall* 3,642 ft. Schl., Herm.

1, Greiner. 1856, Jan. 9, 10^h A.M. A. $26^{\circ} 43' 7$; $41^{\circ} 0$. Gohátti $30^{\circ} 02' 7$; $63^{\circ} 5 = 3,626$ ft.

.. " " 11, 10^h " " $26^{\circ} 41' 8$; $51^{\circ} 4$ " $30^{\circ} 00' 7$; $60^{\circ} 5 = 3,657$ "

Loc. 2) *Level of the Ri-chu* 3,590 ft. Schl., Herm.

.. 52 ft. below the prayer wall; direct measurement.

The river near Nārigún is called sometimes Amartá-chu, sometimes Nārigún-chu; but the name used in preference is Ri-chu, meaning the mountain stream. The name Amartá-chu is in general only given to the stream after the junction of the Ri-chu and Báishma-chu. Schl., Herm.

Loc. 3) *Position of the magnetic instruments* 3,615 ft. Schl., Herm.

25 ft. above the Ri-chu; by direct measurement.

No. 8. BOGAGÁŨ, $26^{\circ} 47'$; $92^{\circ} 4'$, in Bhután, a village below Nārigún.

Loc. 1) *Mean height of the village* 2,189 ft. Schl., Herm.

1, Greiner. 1856, Jan. 14, 10^h 10^m A.M. 27 871; 50 5; 85. Gohátti 30 010; 62 1; 90.

„ 2) *Level of the river at Bogagáũ* 2,179 ft. Schl., Herm.

„ 3) *Halting place of the Bhútias, in the valley above Bogagáũ* 2,208 „ Schl., Herm.

„ 4) *Enlargement of the valley a short distance below Bogagáũ* 2,019 „ Schl., Herm.

= 170 ft. below Bogagáũ; by aneroid.

No. 9. AMARTÁL, $26^{\circ} 43'$; $92^{\circ} 3'$, in Bhután, a village on the upper border of the Bhután-Tarái.

Loc. *Lower part of the village, 9½ feet above the river* . . . 1,020 ft. Schl., Herm.

1, Greiner. 1856, Jan. 15, 1^h 15^m P.M. A. 29 024; 54 9; 75. Gohátti 29 963; 63 8; 89.

No. 10. TASSGÓNG PEAK, $27^{\circ} 16' 5''$; $91^{\circ} 52' 6''$, in Bhután, the next high peak to Tassgóng castle in the direction E. by N., visible from the northern border of Assám.

Loc. *Top of the peak* ab. 14,000 ft. Schl., A. O.

No. 11. BÄR PAHÁR, $26^{\circ} 53'$; $91^{\circ} 48'$, in Bhután, a peak about equally distant from Nārigún and Devangíri, above the sources of the Jía Bär 12,500 ft. Schl., A. O.

Visible in Assám; measured from Desh Dárrang.

No. 12. TASSGÓNG CASTLE, $27^{\circ} 20'$; $91^{\circ} 38'$, in Bhután Monás valley. The castle is built on a rock, on the left bank of the river, the village a little above the river.

Loc. *Castle* 3,182 ft. Pemb.

No. 13. TÁLLUNG, $27^{\circ} 29'$; $91^{\circ} 37'$, in Bhután, Kúlong valley, a village consisting of several groups of houses, partly built on the river, partly on a terrace to the left of it.

Loc. *Houses on the terrace* 5,929 ft. Pemb.

No. 14. RUNGKÓNG TEMPLE, $27^{\circ} 15'$; $91^{\circ} 36'$, in Bhután, on the crest separating the Jhíri and Monár ab. 8,300 ft. Schl., A. O.

No. 15. RAIDÁNG MOUNTAIN, $26^{\circ} 58'$; $91^{\circ} 34'$, in Bhután, near the village of Raidáng, on the right bank of the Múru ab. 7,000 ft. Schl., A. O.

- No. 16. BULFÁI, $27^{\circ} 13'$; $91^{\circ} 34'$, in Bhután, Jhíri valley 6,804 ft. Pemb.
-
- No. 17. TASSÁNGSI CASTLE, $27^{\circ} 34'$; $91^{\circ} 33'$, in Bhután, Kúlong valley.
 Loc. *Castle of the Súbah* 5,387 ft. Pemb.
-
- No. 18. DEVANGÍRI, $26^{\circ} 51'$; $91^{\circ} 30'$, in Bhután, in the outer ranges of the Himálaya, on the left bank of the Múru.
 Loc. *Residence of the Devangíri Rájah* 2,150 ft. Pemb.
-
- No. 19. SÁSI, $27^{\circ} 8'$; $91^{\circ} 29'$, in Bhután, near the junction of the Thémeri and Jhíri.
 Loc. *Mean height of the village* 4,325 ft. Pemb.
-
- No. 20. LÁNJE VILLAGE, $27^{\circ} 36'$; $91^{\circ} 16'$, in Bhután, on a slope to the left of the Kúri.
 Loc. *Undefined* 6,336 ft. Pemb.
-
- No. 21. LENG LÚNG CASTLE, $27^{\circ} 39'$; $91^{\circ} 12'$, in Bhután, on the Kúri.
 Loc. *Undefined* 4,523 ft. Pemb.
-
- No. 22. SASÚKA PASS, $27^{\circ} 46'$; $90^{\circ} 48'$, in Bhután, on the road from Jágger viá Dáru to Lhússa 12,335 ft. Pemb.
-
- No. 23. BUMBANGTÁNG, $27^{\circ} 36'$; $90^{\circ} 47'$, in Bhután, on the Tang.
 Loc. *Undefined* 8,668 ft. Pemb.
-
- No. 24. JÁGGĀR CASTLE, $27^{\circ} 32'$; $90^{\circ} 37'$, in Bhután, on the right bank of the Sámkat.
 Loc. *Castle of the Súbah* 8,149 ft. Pemb.
-
- No. 25. TÓNGSO CASTLE, $27^{\circ} 30'$; $90^{\circ} 19'$, in Bhután, on the right bank of the Matisúm.
 Loc. *Castle* 6,527 ft. Pemb.
-
- No. 26. SANTAGÁŮ, $27^{\circ} 31'$; $89^{\circ} 44'$, in Bhután, 11 miles S.E. of Punáka.
 Loc. *Undefined* 6,325 ft. Pemb.
-

No. 27. PHÁEN, $27^{\circ} 29'$; $89^{\circ} 39'$, in Bhután, 8 miles S.E. of Punákha.

Loc. *Mean height of the village* 5,279 ft. Pemb.

No. 28. TAGÚNA FORT, $26^{\circ} 59'$; $89^{\circ} 38'$, in Bhután, 10 miles N.N.E. of the Gáddáda valley 3,783 ft. Pemb.

No. 29. PUNÁKHA CASTLE, $27^{\circ} 35'$; $89^{\circ} 34'$, in Bhután, at the junction of the Ma-chu and Pa-chu 3,739 ft. Pemb.

No. 30. PUSÁKHA, or BAKSA DUÁR, $26^{\circ} 48'$; $89^{\circ} 31'$, one of the principal passes leading into Bhután 1,809 ft. Pemb.

Similar secondary passes are crossed in many parts of the outer ranges of the Himálaya, in order to avoid routes which, either from the marshy ground of the Tarái, or the steep erosion of the rivers, present too many difficulties. Schl., Herm.

No. 31. CHÚPCHA, $27^{\circ} 11'$; $89^{\circ} 17'$, in Bhután, on the left bank of the Gáddáda.

Loc. *Mean height of the village* 7,984 ft. Pemb.

No. 32. CHAMALHÁRI PEAK (No. I. $\frac{1}{2}$), $27^{\circ} 49' \cdot 7$; $89^{\circ} 15' \cdot 3$, in Bhután.

Loc. *Top of the peak* 23,944 ft. G. T. S.

In the Fálút panorama its distance is $77\frac{1}{4}$ miles. This summit is a remarkably well defined conical prominence with a flattened top, steeper on its eastern than on its western slopes. Its Léпча name is Rímyet-rim-Sáchu; for its signification see the Glossary in Vol. III. Schl., Herm.

No. 33. CHÓRA PEAK, $27^{\circ} 42' \cdot 2$; $89^{\circ} 14' \cdot 5$, in Bhután, above the village Chóra.

Loc. *Top of the peak* 22,720 ft. Schl., Herm.

This peak, measured from Nankláu, is situated on the spur which descends from the Chamalhári peak to the south towards Tassisúdon.

Another high peak, situated $1^{\circ} 29'$ E. of Chamalhári, was only visible from the western end of the Nankláu base. Schl., Herm.

No. 34. TÁNKRA PASS, $27^{\circ} 37'$; $88^{\circ} 54'$, on the Síkkim-Bhután frontier, leading from Síkkim into Bhután 16,083 ft. Hook.

No. 35. GIPMÓCHI PEAK, $27^{\circ} 17'$; $88^{\circ} 53'$, in Bhután . 14,509 ft. G. T. S.

This peak, the most eastern prominent object in the snowy range seen from Fálút, is free from snow during the warmest months. The chain to its left, now (June, 1855) still covered with

a thick stratum of snow, is the left side of the Ríngpo river, and the crest descending below it to the right is the ridge separating the Ríngpo from the Tísta valley. Schl., Herm.

No. 36. \triangle LÁCHI-PIÁ, $27^{\circ} 40'$; $88^{\circ} 51'$, in Sikkim, a halting place at the southern foot of the Tánkra peak 15,262 ft. Hook.

No. 37. FORKED DÓNKIA PEAK, $27^{\circ} 52'$; $88^{\circ} 51'$, on the Sikkim-Bhután frontier.

Loc. *Top of the peak* 20,870 ft. G. T. S.

In the Fálút panorama it seems to be concealed by one of the ridges, which are less distant.

No. 38. TÁNKRA PEAK, $27^{\circ} 45'$; $88^{\circ} 50'$, in Sikkim, 7 miles N.E. of the Láchung valley.

Loc. *Top of the peak* 18,250 ft. Hook.

This peak is visible from Darjiling. Schl., Herm.

No. 39. PAUHÁNRI, or DÓNKIA PEAK (No. III. $\frac{1}{2}$), $27^{\circ} 57' \cdot 0$; $88^{\circ} 49' \cdot 7$, on the Sikkim-Tibet frontier.

Loc. 1) *Top of the peak* 23,136 ft. G. T. S.

In the Fálút panorama the distance is 71 miles; the peak presents itself as a very powerful pyramid, with a sharp point. Schl., Herm.

Loc. 2) *Southern shoulder of the Dónkia peak* 18,307 ft. Hook.

„ 3) *Western shoulder of the Dónkia peak* 18,510 „ Hook.

No. 40. CHÓLA PASS, $27^{\circ} 25'$; $88^{\circ} 49'$, on the Bhután-Sikkim frontier, leading from the Tísta river system into that of the Ma-chu 14,925 ft. Hook.

In the Fálút panorama the depression of the pass is visible, but its lowest point, the pass itself, is concealed by parallax; the pass is considerably lower than the general crest of the snowy range. Schl., Herm.

No. 41. CHÓLA MOUNTAIN, $27^{\circ} 27'$; $88^{\circ} 47'$, on the Sikkim-Bhután frontier.

Loc. *Top of the mountain* 17,319 ft. G. T. S.

Visible in the Fálút panorama to the right of the Chóla pass. Schl., Herm.

No. 42. DÓNKIA PASS, $27^{\circ} 59'$; $88^{\circ} 47'$, in Sikkim, on a spur of the Dónkia mountain 18,488 ft. Hook.

No. 43. CHOLÁMU LAKE, $28^{\circ} 0'$; $88^{\circ} 47'$, in Dingsam, a province of Eastern Tibet, at the foot of the Dónkia peak.

Loc. *Broad plain surrounding the lake* 16,900 ft. Hook.

No. 44. \triangle CHAMANÁKO, $27^{\circ} 24'$; $88^{\circ} 46'$, in Sikkim, a halting place on the road leading over the Chóla pass 12,590 ft. Hook.

No. 45. GUAREÁM, or BLACK ROCK PEAK, $27^{\circ} 35'$; $88^{\circ} 45'$, in Sikkim.

Loc. *Top of the peak* 17,556 ft. G. T. S.

In the Fálút panorama it has a rather broad upper margin, with a double pyramid on its top. Schl., Herm.

No. 46. LÁCHUNG, $27^{\circ} 42'$; $88^{\circ} 45'$, in Sikkim, a village on the left bank of the Láchung, which is the most eastern of the principal affluents of the Tista . 8,630 ft. Hook.

No. 47. \triangle MOMÁI SÁMDONG, $27^{\circ} 52'$; $88^{\circ} 44'$, in Sikkim, at the confluence of numerous streams descending from the glaciers of the Kinchinjáhu and Dónkia systems.

Loc. 1) *Camp* 15,215 ft. Hook.

„ 2) *Mountain N. of the village* 17,394 „ Hook.

No. 48. \triangle BARFÓNCHEN, $27^{\circ} 24'$; $88^{\circ} 44'$, in Sikkim, a halting place on the road leading over the Chóla pass 11,233 ft. Hook

No. 49. FIÖNGÚNG, $27^{\circ} 25'$; $88^{\circ} 43'$, in Sikkim, a lofty step on the road over the Chóla pass 12,423 ft. Hook.

No. 50. YÖMTÓNG, $27^{\circ} 46'$; $88^{\circ} 43'$, in Sikkim, a small summer cattle station, on a flat formed by the Láchung.

Loc. 1) *Flat equally high on both sides of the river* 11,904 ft. Hook.

„ 2) *Snow-bed above Yömtóng* 15,985 „ Hook.

„ 3) *Hot springs (Temp. $112^{\circ} \cdot 6$ Fahr.), 1 mile below Yömtóng* 11,730 „ Hook.

„ 4) *Bas névé and snow bridges in August* 12,500 „ Hook

„ 5) *Limit of silver firs* 13,000 „ Hook.

„ 6) *Lower end of the Chángo Khang glacier* 14,000 „ Hook.

- Loc. 7) *Limit of oaks* 9,000 ft. Hook.
 „ 8) \triangle *Pangíng, a halting place near Yömtóng* 11,299 „ Hook.

No. 51. TÓMO CHÁMO PEAK, $27^{\circ} 56'$; $88^{\circ} 43'$, in Sikkim, the eastern summit of the Kinchinjháu massif ab. 21,000 ft. Hook.

The upper part of this peak also presented itself so flat in the Fálút panorama, that the proper summit is not visible. Schl., Herm.

No. 52. LAGHÉP, $27^{\circ} 25'$; $88^{\circ} 41'$, in Sikkim, a small stone house on the road over the Chóla pass 10,423 ft. Hook.

No. 53. KINCHINJHÁU MASSIF, $27^{\circ} 56'$; $88^{\circ} 40'$, in Sikkim.

Loc. 1) *Highest peak of the massif* 22,750 ft. G. T. S.

In the Fálút panorama, the highest peak is hardly visible, but the general elevation of this powerful group forms a prominent object. Schl., Herm.

Loc. 2) *Hot springs, about a mile below the Kinchinjháu glacier* 16,000 ft. Hook.

No. 54. \triangle YEÚM TSO, $28^{\circ} 2'$; $88^{\circ} 40'$, in Sikkim, a large flat, N. of the Kóngra Láma pass, with many small lakes.

Loc. *Cattle pen at the eastern border* 16,808 ft. Hook.

No. 55. BHÓM TSO PEAK, $28^{\circ} 6'$; $88^{\circ} 40'$, in Dingsam, a province of Eastern Tibet, N. of Sikkim 18,590 ft. Hook.

No. 56. SEBÓLA PASS, $27^{\circ} 50'$; $88^{\circ} 38'$, in Sikkim, leading over the northern shoulder of the Changokháng peak from the Láching into the Láchén valley . . 17,585 ft. Hook.

No. 57. CHANGOKHÁNG PEAK, $27^{\circ} 53'$; $88^{\circ} 38'$, in Sikkim 20,600 ft. Hook.

The name of this peak, which dominates the Sebóla pass, means "Eagles' crag". Schl., Herm.

No. 58. RÁNKPO, $27^{\circ} 24'$; $88^{\circ} 37'$, in Sikkim, a village with a rest-house at the foot of the ascent to Fám long, on the right bank of the Ráiot 6,008 ft. Hook.

No. 59. Δ PÁLUNG, $27^{\circ} 55'$; $88^{\circ} 37'$, in Sikkim, an elevated grassy expanse at the foot of Kinchinjáu, with large ancient moraines.

- Loc. 1) *Mean height of the plain* 16,000 ft. Hook.
 „ 2) *Dr. Hooker's encamping place* 15,697 „ Hook.

No. 60. Δ CHÁKUNG, $27^{\circ} 33'$; $88^{\circ} 36'$, in Sikkim, a halting place with grass huts on the left bank of the Tista.

- Loc. *Bottom of the valley* 3,407 ft. Hook.

No. 61. CHÚNGTAM, $27^{\circ} 37'$; $88^{\circ} 36'$, in Sikkim, a village near the junction of the Tista and Láchung.

- Loc. 1) *Mean height of the village* 5,268 ft. Hook.
 „ 2) *Level of the Láchung at Chúngtam* 4,968 „ Hook.
 „ 3) *Lower limit of the Yew tree* 7,000 „ Hook.
 „ 4) *Lower limit of "Abies Brunoniana"* 8,000 „ Hook.

No. 62. TÁKCHÁM, $27^{\circ} 21'$; $88^{\circ} 35'$, in Sikkim, a village 6 miles S. of Pámlung in a straight line 3,849 ft. Hook.

No. 63. Δ YÉUNGA, $27^{\circ} 48'$; $88^{\circ} 35'$, in Sikkim, a halting place 3 miles N. of the junction of the Láchen and Zimu 10,196 ft. Hook.

No. 64. TÁLLUM SÁMDONG, $27^{\circ} 50'$; $88^{\circ} 35'$, in Sikkim, a village on the left bank of the Láchen, consisting only of a few stone huts 11,482 ft. Hook.

No. 65. DÍKILING, $27^{\circ} 15'$; $88^{\circ} 34'$, in Sikkim, a large settlement of Dhárma Bhútias, 5 miles N.E. of the junction of the Rángpo and Tista.

- Loc. 1) *Mean height of the settlement* 4,952 ft. Hook.
 „ 2) *Síngdong, a settlement 3 miles lower down* 2,116 „ Hook.

No. 66. TIKBOTÁNG, $27^{\circ} 19'$; $88^{\circ} 34'$, in Sikkim, a village on the Rángnu, an affluent of the Tista.

- Loc. 1) *Village* 3,762 ft. Hook.
 „ 2) Δ Gángtok Sampú, some miles lower down 2,952 „ Hook.
 „ 3) Δ Seriómso 2,820 „ Hook.

No. 67. TÁMLUNG, $27^{\circ} 25'$; $88^{\circ} 34'$, in Sikkim, the capital of this province, on a hill on the left bank of the Tista.

Loc. 1) <i>Lower part of the town</i>	5,368 ft. Hook.
„ 2) <i>Upper part of the town</i>	5,976 „ Hook.
„ 3) <i>Padóng temple, S.W. of Tamlung</i>	5,946 „ Hook.

No. 68. NÁMGA, $27^{\circ} 32'$; $88^{\circ} 34'$, in Sikkim, on the left bank of the Tista, on a spur a little above Nióng 4,229 ft. Hook.

No. 69. Δ DHÓLEP LÁCHEN, $27^{\circ} 38'$; $88^{\circ} 34'$, in Sikkim, a halting place on the right bank of the Tista 6,132 ft. Hook.

No. 70. Δ LÁTONG, $27^{\circ} 42'$; $88^{\circ} 34'$, in Sikkim, a halting place on the left bank of the Tista 6,390 ft. Hook.

No. 71. Δ KÁMPO SÁMDONG, $27^{\circ} 45'$; $88^{\circ} 34'$, in Sikkim, name of the junction of the Láchen and a small lateral river from the left 7,329 ft. Hook.

No. 72. Δ TÁNGU, $27^{\circ} 53'$; $88^{\circ} 34'$, in Sikkim, the name of the junction of the Láchen and Tángu 12,762 ft. Hook.

No. 73. YANKÚNG, $27^{\circ} 23'$; $88^{\circ} 33'$, in Sikkim, a village near the left bank of the Tista, 4 miles distant from the river 3,867 ft. Hook.

No. 74. NIÓNG, $27^{\circ} 32'$; $88^{\circ} 33'$, in Sikkim, a village on the left bank of the Tista, $3\frac{1}{2}$ miles N.E. of Singtam 3,954 ft. Hook.

No. 75. Δ DÉNGHA, $27^{\circ} 41'$; $88^{\circ} 33'$, in Sikkim, a halting place on the right bank of the Tista 6,368 ft. Hook.

No. 76. LÁMTENG, $27^{\circ} 45'$; $88^{\circ} 33'$, in Sikkim, a village of about 40 houses, only inhabited in winter, the shepherds with their flocks being in Tibet during the summer.

Loc. *Undefined* 8,883 ft. Hook.

No. 77. ZÍMU SÁMDONG, 27° 46'; 88° 33', in Sikkim, junction of the Láchén and Zímu:

Loc. 1) *Level of the confluence* 8,976 ft. Hook.

„ 2) *Bas névé, forming a snow bridge across the Zímu*
in June (1849) 9,828 „ Hook.

No. 78. SITTÓNG, 27° 58'; 88° 33', in Sikkim, at the foot of the Kóngra Láma pass.

Loc. *Lower end of the rocky glen* 15,372 ft. Hook.

No. 79. KÓNGRA LÁMA PASS, 27° 59'; 88° 33', in Sikkim, leading over a spur of the Kinchinjháu.

Loc. 1) *Top of the pass* 15,693 ft. Hook

This pass only leads from a lower to a higher part of the same valley, to avoid the difficulties presenting themselves along the course of the river. Schl., Herm.

Loc. 2) *Upper limit of "Ephedra vulgaris"* 17,000 ft. Hook.

No. 80. CHÁTENG, 27° 45'; 88° 32', in Sikkim, eastern termination of a spur descending from the Tākchám peak.

Loc. 1) *Small pool on its summit* 8,757 ft. Hook.

„ 2) *Upper limit of "Marlea"* 8,500 „ Hook.

This is the greatest elevation attained by sub-tropical tree vegetation in the interior of Sikkim.

No. 81. SINGTÁM, 27° 31'; 88° 31', in Sikkim, a village in the great bend of the Tista, 10 miles N.W. of Tamlung. 4,456 ft. Hook.

No. 82. CHOMIOMÓ PEAK, 28° 1'; 88° 31', on the Sikkim-Tibet frontier, S.E. of Bhóntso.

Loc. *Top of the peak* 22,700 ft. Hook.

No. 83. TĀKCHÁM PEAK, 27° 44'; 88° 30', in Sikkim, a snow peak surrounded by a great accumulation of glaciers on the right bank of the Tista, 5 miles S.W. of the junction of the Láchén and Zímu.

Loc. 1) *Top of the peak* 19,473 ft. Hook

„ 2) *Lower limit of the glaciers* 14,000 „ Hook.

No. 84. BHOMSÓNG, 27° 21'; 88° 29', in Sikkim, on the right bank of the Tista, 8 miles E. of the Máinom mountain.

Loc. *Undefined* 1,544 ft. Hook.

No. 85. KÉADOM, $27^{\circ} 24'$; $88^{\circ} 29'$, in Sikkim, a village on the right bank of the Tista, nearly opposite Tamlung, the capital of Sikkim 6,609 ft. Hook.

No. 86. GORH, $27^{\circ} 27'$; $88^{\circ} 29'$, in Sikkim, a village on the right bank of the Tista.
Loc. *Mean height of the village* 4,128 ft. Hook.

No. 87. BLINGBÓNG, $27^{\circ} 29'$; $88^{\circ} 29'$, in Sikkim, a village on the right bank of the Tista, 3 miles N. of Gorh 2,684 ft. Hook.

No. 88. LÍNGO, $27^{\circ} 31'$; $88^{\circ} 29'$, in Sikkim, a village on the right bank of the Tista, $1\frac{1}{2}$ mile below its junction with the Rangjáng 2,781 ft. Hook.

No. 89. CHEADÁM, $27^{\circ} 9'$; $88^{\circ} 28'$, in Sikkim, a village on a ridge separating the Tista and Rängít, 4 miles from their junction 4,653 ft. Hook.

No. 90. KÁTONG GHAT, $27^{\circ} 12'$; $88^{\circ} 28'$, in Sikkim, 3 miles above the junction of the Tista and Ríngpo 735 ft. Hook.

No. 91. LINGMÓ, $27^{\circ} 19'$; $88^{\circ} 28'$, in Sikkim, a village on the right bank of the Tista, 2 miles above the junction with the Brum 2,849 ft. Hook.

No. 92. LÍNGTAM SPUR, $27^{\circ} 31'$; $88^{\circ} 28'$, in Sikkim, near the junction of the Rangjáng and the Tista 4,805 ft. Hook.

NOS. 93-5. PANDÍM PEAKS, in Sikkim.

No. 93. PANDÍM PEAK *D 3* †, $27^{\circ} 44'$; $88^{\circ} 28'$ 19,244 ft. G. T. S.

No. 94. PANDÍM PEAK *D 2* †, $27^{\circ} 42'$; $88^{\circ} 18'$ 22,581 ft. G. T. S.

No. 95. PANDÍM PEAK NO. VII. ‡, $27^{\circ} 34'\cdot6$; $88^{\circ} 12'\cdot2$. 22,017 ft. G. T. S.

Visible in the Fálút panorama; its eastern part seems to conceal the two peaks in the southern prolongation of the ridge; peaks *D 3* and *D 2* are, however, not visible. Schl., Herm.

No. 96. THLÓNOK PEAK, $27^{\circ} 58'$; $88^{\circ} 28'$, in Sikkim, a prominent object in the ridge separating the Láchen and Zimu valleys ab. 20,000 ft. Hook.

NO. 97. ZÍMU RIVER, $27^{\circ} 59'$; $88^{\circ} 28'$, in Sikkim, at the junction with the Thlónok; both are tributaries of the Láchén 10,846 ft. Hook.

NO. 98. NÁMTEN, $27^{\circ} 11'$; $88^{\circ} 27'$, in Sikkim, a village on a ridge separating the Tista and Rängft, 7 miles from their junction 4,483 ft. Hook.

NO. 99. NÁMPOK, $27^{\circ} 16'$; $88^{\circ} 27'$, in Sikkim, a village on the right bank of the Tista. Loc. *Mean height of the village* 5,085 ft. Hook.

NO. 100. NEÓNGONG, $27^{\circ} 18'$; $88^{\circ} 26'$, in Sikkim, a large monastery at the south-eastern foot of the Máinom mountain 5,225 ft. Hook.

NO. 101. ZÍMU RIVER, $27^{\circ} 52'$; $88^{\circ} 26'$, in Sikkim, 3 miles S.W. of the junction with the Thlónok 12,069 ft. Hook.

NO. 102. SÍNGDOM PASS, $27^{\circ} 18'$; $88^{\circ} 24'$, in Sikkim, a pass leading from the Tista valley into that of the Great Rängft. 6,824 ft. Hook.

NO. 103. TÉNDONG MOUNTAIN, $27^{\circ} 13'$; $88^{\circ} 23'$, in Sikkim, a well marked peak on the ridge separating the Rängft and Tista.

Loc. 1) *Top of the mountain* 8,667 ft. Hook.

„ 2) *Námchi, a step on the spur, descending from Téndong to the south* 5,608 „ Hook.

„ 3) *Témi, a step on the north-eastern slopes of the Téndong mountain* 4,771 „ Hook

NO. 104. MÍK, $27^{\circ} 19'$; $88^{\circ} 23'$, in Sikkim, a village on the southern slope of the Téndong mountain 3,912 ft. Hook.

NO. 105. MÁINOM MOUNTAIN, $27^{\circ} 21'$; $88^{\circ} 23'$, in Sikkim, between the Tista and Great Rängft valleys.

Loc. 1) *Top of the mountain* 10,657 ft. Hook.

„ 2) *Námpak village, N.E. of Máinom mountain* 4,427 „ Hook.

No. 106. LÍNGTAM, $27^{\circ} 18'$; $88^{\circ} 21'$, in Sikkim, on the road leading from the Rāngt to the Tista valley 5,554 ft. Hook.

No. 107. RANGTÚ SPUR, $27^{\circ} 1'$; $88^{\circ} 20'$, in Sikkim, $5\frac{1}{2}$ miles E. of Darjiling.
Loc. *Police thánah* ab. 5,000 ft. Sherwill.

No. 108. TÉNGLING, $27^{\circ} 22'$; $88^{\circ} 20'$, in Sikkim, a village on the way from the Changa-chélling temples to the Téngling 5,257 ft. Hook.

No. 109. KATSUPÉRRÍ LAKE, $27^{\circ} 23'$; $88^{\circ} 19'$, in Sikkim, on the right bank of the Rátong, 3 miles W. of Yóksun. .

Loc. 1) *Level of the lake* 6,038 ft. Hook.
.. 2) *Temple near the lake* 6,484 „ Hook.

No. 119. RĀNGBI RIVER, 27° 20'; 88° 16', in Sikkim, near its junction with the Rātong.

Loc. *Level of the junction* 3,165 ft. Hook.No. 120. DARJÍLING, 27° 3'·0; 88° 15'·3⁺, in Sikkim, a large station and well known sanitarium.Loc. 1) *Top of the Observatory hill* 7,168 ft. G. T. S.

This hill, one of the best defined localities of the station, is situated near the separation of the Libóng and Takvár spurs. The instruments of Dr. Withecombe, as well as my own (I inhabited a house close by, Ada Villa), had been put up at this place, to which all my barometrical measurements in Sikkim are referred.

In the following list of various localities in the station, the points determined follow each other from east to west, and from north to south. The ridge along which the station is built divides itself to the north in the Libóng and Takvár spurs, and continues to the south by the Jillapahár spur.

All the following localities are laid down on the very detailed "Index Map to the Locations at Darjiling," surveyed in 1856, by Capt. W. S. Sherwill. The scale of the map is $6\frac{1}{2}$ inches = 1 mile.

Loc. 2)	<i>Bannock burn, on Libóng spur, 1 mile N.E. of the</i>

No. 137. MON LÉPCHA MOUNTAIN, $27^{\circ} 29'$; $88^{\circ} 11'$, in Sikkim, on the right bank of the Rátong 13,067 ft. Hook.

No. 138. LITTLE RĀNGÍT RIVER, $27^{\circ} 4' 8$; $88^{\circ} 10' 3$ P, in Sikkim, W. of Darjiling.

Loc. 1) *Suspension bridge below Saimonbóng*. 2,780 ft. Schl., Herm.

14, Newman. 1855, June 15, 2^h P.M. A. $26^{\circ} 861$; $77^{\circ} 2$; 90 . Tónglo $20^{\circ} 698$; $49^{\circ} 3$; 92 . + $73 = 2,781$ ft.
Darjiling $23^{\circ} 044$; $62^{\circ} 1$; 94 . + $44 = 2,779$ ft.

Loc. 2) *Step on the left shore of the river, on a secondary terrace of the steep bank of erosion* 3,130 ft. Schl., Herm.

This was the place where my magnetic instruments were put up.

No. 139. RÁTONG RIDGE, $27^{\circ} 40'$; $88^{\circ} 10'$, in Sikkim, a spur connecting Kanchinjंगा with the Pandim ridge, with very large glaciers on its northern and southern flanks.

Loc. *Mean height of the ridge* 24,957 ft. Schl., Herm.

The height is deduced from horizontal and vertical angles from various points of the Singhalila ridge. The eastern end of this ridge was not visible. Schl., Herm.

No. 140. SALMONBÓNG, $27^{\circ} 5'$; $88^{\circ} 9'$, in Sikkim, a Láma's residency at the lower end of a spur descending from Tónglo.

Loc. *Upper buildings of the Lámas* 5,674 ft. Schl., Herm.

14, Newman. 1855, June 15, 8^h 30^m A.M. A. 24.375; 62.6. Tónglo 20.835; 50 0. — 43 — 5,696 ft.

Darjiling 23.096; 57.2. — 15 = 5,651 ft. —

No. 141. YANGPÚNG, $27^{\circ} 30'$; $88^{\circ} 9'$, in Sikkim, a mountain 4 miles N. of Mon Lépha.

Loc. *Top of the mountain* 13,172 ft. Hook.

Nos. 142-3. KANCHINJÍNGA PEAKS, on the Sikkim-Tibet frontier.

No. 142. KANCHINJÍNGA EAST PEAK No. VIII. \ddagger , $27^{\circ} 41' 5''$; $88^{\circ} 8' 4''$.

Loc. *Top of the peak* 27,815 ft. G. T. S.

No. 143. KANCHINJÍNGA WEST PEAK No. IX. \ddagger , $27^{\circ} 42' 1''$; $88^{\circ} 8' 0''$.

Loc. *Top of the peak* 28,156 ft. G. T. S.

This peak is only exceeded in height as yet (1861) by the Gaurisáňkar in Nepál, and the Dápsang peak in the Karakorúm chain. The latter peak, marked by the G. T. S. K2, in Lat. N. $35^{\circ} 41'$; Long. E. Gr. $76^{\circ} 48'$, attains a height of 28,278 ft. See Journal of the Asiatic Society of Bengál, 1860, No. I., p. 21. Kanchinjínga forms a central and predominant object in the Sikkim panorama of the snowy range; and is figured in detail on the plate, No. 2, of our Atlas of Panoramas and Views

Kanchinjínga presents itself from Fálút under a vertical angle of $4^{\circ} 51' 10''$, and even the lowest point of the junction between Kábru and Kanchinjínga (the curve seen just below the eastern peak) has still in the panorama an angular height of $3^{\circ} 36'$. The peak is 181,632 feet distant from Fálút. (See p. 292). Schl., Herm.

No. 144. GUNG RIDGE, $26^{\circ} 57'$; $88^{\circ} 8'$, in Sikkim, a lateral spur of the Sinchal ridge in an east-westerly direction. 7,441 ft. Hook.

No. 145. BALASÚN RIVER, $26^{\circ} 58'$; $88^{\circ} 8'$, in Sikkim, on the southern side of the Gung ridge.

Loc. *Source of the river* 7,443 ft. Hook.

No. 146. CHANGACHÉLLING, $27^{\circ} 18'$; $88^{\circ} 7'$, in Sikkim, a Buddhist temple, 2 miles N. of the Kálhét 6,827 ft. Hook.

No. 147. MÁYONG RIVER, $26^{\circ} 27'$; $88^{\circ} 6'$, in Eastern Nepál, on the western side of a spur, descending to the south from Tónglo.

Loc. *Source of the river* 4,798 ft. Hook.

No. 148. KÁBRU PEAK (No. x. $\frac{1}{2}$), $27^{\circ} 36' \cdot 5$; $88^{\circ} 5' \cdot 8$, in Sikkim.

Loc. *Top of the peak* 24,015 ft. G. T. S.

This peak, notwithstanding its great absolute height, forms but a secondary object of the massif of Kanchinjunga in the Fúlút panorama. Schl., Herm.

No. 149. MÁYONG VALLEY, $26^{\circ} 57'$; $88^{\circ} 4'$, in Eastern Nepál, 6 miles S. of the Tónglo mountain, near which it commences.

Loc. 1) *Undefined* 4,345 ft. Hook.

„ 2) *8 miles S. of the Tónglo mountain* 3,782 „ Hook.

No. 150. TÓNGLO MOUNTAIN $27^{\circ} 1' \cdot 8$; $88^{\circ} 3' \cdot 9 \frac{1}{2}$, in Sikkim, the most southern prominent point of the Singhalila ridge.

Loc. 1) *Top of the mountain* 10,080 ft. G. T. S.

„ 2) *Grove at the foot of the peak, with a small pool
surrounded by rhododendron trees* 9,891 „ Schl., Herm.

5, Adic. 1855, May 10, 8^h 30^m A.M. A. 21·005; 50·7; 83. Darjiling, 23·165; 51·6; 65· + 27 = 9,883 ft.

„ „ „ 9^h 45^m „ „ 20·980; 53·4; 81. „ 23·159; 53·6; 60· + 0 = 9,899 „

Loc. 3) *Saddle below the summit* 10,008 „ Hook.

„ 4) *Rocks on the ascent to Tónglo* 8,148 „ Hook.

„ 5) *Upper limit of palms* 6,500 „ Schl., Herm.

„ 6) *Upper limit of "Pinus longifolia"* 3,000 „ Schl., Herm.

„ 7) *Upper limit of "Gordonia Wallichii"* 4,000 „ Hook.

„ 8) *Upper limit of figs and Tetranthera* 9,000 „ Hook.

„ 9) *Upper limit of Cinnamomum* 8,500 „ Hook.

No. 151. CHANGTÁBU MOUNTAIN, $27^{\circ} 20'$; $88^{\circ} 3'$, in Sikkim, on the Singhalila ridge.

Loc. 1) *Top of the mountain* 11,963 ft. G. T. S.

„ 2) *Camp in a little plain, S.W. of the mountain* . . . 11,710 „ Schl., Herm.

14, Newman. 1855, June 1, 6^h 30^m P.M. A. 19·534; 45·3; 82. Darjiling 23·024; 61·0; 90· + 0 = 11,700 ft.

„ „ „ 2, 8^h 0^m A.M. „ 19·587; 48·0; 84. „ 23·049; 59·7; 91· + 45 = 11,720 „

No. 152. PARMÍÓKSONG, $26^{\circ} 55'$; $88^{\circ} 2'$, in Eastern Nepál, a village on the right bank of the Máyong 4,521 ft. Hook.

No. 153. ISLÚMBO PASS, $27^{\circ} 17'$; $88^{\circ} 2'$, in Eastern Nepál, leading from Nepál to Sikkim over the northern continuation of the Singhalila ridge.

- Loc. 1) *Top of the pass* 10,388 „ Hook.
 „ 2) *Terrace on the western slopes of the pass* 9,295 ft. Hook.
 „ 3) *Western foot of the Islúmbo pass, on the Íva* . . . 6,159 „ Hook.

No. 154. GÓZA MOUNTAIN, $27^{\circ} 16' \cdot 5$; $88^{\circ} 1' \cdot 8$ P, in Sikkim, the next peak in a north-easterly direction to Fálút, bearing from Fálút N. $20\frac{1}{2}^{\circ}$ E.

- Loc. 1) *Top of the mountain* 12,080 ft. Schl., Herm.

1, Greiner. 1855, June 3, 9^h A.M. A. $19^{\circ} 354$; $53^{\circ} 6$; 72. Darjiling $23^{\circ} 087$; $61^{\circ} 3$; 82.

- Loc. 2) *Upper limit of Tree Rhododendrons on the Sikkim*

side; Exposition East 9,500 ft. Schl., Herm.

The limit of the tree rhododendrons is decidedly lower on all the surrounding mountains, than the environs of Tónglo. Schl., Herm.

No. 155. JÁNNU (No. XI. ᠵ), $27^{\circ} 40' \cdot 9$; $88^{\circ} 1' \cdot 8$, in Sikkim 25,304 ft. G. T. S

A very well defined peak, connected on the south-west with the Chunjérma range. Schl., Herm.

No. 156. SÁLLUBÓNG, $26^{\circ} 57'$; $88^{\circ} 1'$, in Eastern Nepál, a village near the southern end of a ridge forming the watershed between the rivers Máí and Paúu.

- Loc. *Undefined* 5,277 ft. Hook.

No. 157. NÁNGI, or NÁNKI PASS, $27^{\circ} 1'$; $88^{\circ} 1'$, in Sikkim, a considerable depression in the Singhalila ridge near the Tónglo mountain.

- Loc. 1) *Top of the pass* 9,643 ft. Schl., Herm.

14, Newman. 1855, June 13, 8^h 45^m P.M. A. $21^{\circ} 064$; $49^{\circ} 8$; 90. Darjiling $23^{\circ} 036$; $58^{\circ} 2$; 95

- Loc. 2) *Limit of bamboos, 14 feet in length, 2 to 3 inches*

in diameter 10,293 ft. Schl., Herm.

= 650 ft. above the top of the pass; by aneroid.

A depression of about 9,800 ft. also presented itself a little farther north, only a few miles S. of the Chandanángi mountain, but it was not separately measured. Schl., Herm.

No. 158. CHÁNDA NÁNGI MOUNTAIN, $27^{\circ} 5' \cdot 5$; $88^{\circ} 1' \cdot 0$ P, in Sikkim, in the Singhalila ridge, from which a large spur descends to the Ramám in a north-easterly direction, while a ridge of more uniform height, called the Sákiazáng, branches off to the west.

- Loc. 1) *Top of the mountain* 11,971 ft. Schl., Herm.

14, Newman. 1855, June 13, 8^h 45^m A.M. A. $19^{\circ} 433$; $43^{\circ} 9$. Fálút $19^{\circ} 382$; $43^{\circ} 3$.

The latitude and longitude of this mountain was deduced from bearings to Síncal and Téndon. The readings gave an angular distance between these two mountains of $50^{\circ} 20'$.

Captain Sherwill, who calls this peak "Sundhukpho", obtains its height = 11,963 ft. Hooker calls this peak "Phulloot."

Loc. 2) *Encampment at the foot of the rocky summit*, 1855,

June 12 to 13 11,851 ft. Schl., Herm.

= 120 ft. below the summit; by aneroid.

.. 3) *Encampment*, 1855, May 17 to 18 11,051 ,, Schl., Herm.

= 920 ft. below the summit; by aneroid.

This encampment, under a wall of rocks on the eastern slopes of the mountain, was my second halting place N. of Tónglo. Though unfavourably situated, on account of the scarcity of water, we were obliged to make a halt here. My kúlis encamped 150 ft. lower down, at a spot where they found a little ravine for protection and shelter, and a spring. A most violent thunder-storm with hail set in soon after our tents were pitched, and lasted all night. Schl., Herm.

Loc. 4) *Forest of dead trees (Abies Webbiana); Expo-*

sition S.E. 10,628 ft. Schl., Herm.

= 1,243 ft. below the summit; by aneroid.

This species of "Abies" grows much lower on slopes of north or north-east exposition. In these regions, where man does not interfere with the development of vegetation, the upper limits, as well as the lower, are very often marked by a great number of dead trees. Schl., Herm.

Loc. 5) *Depression in the Singhatila ridge, 3 miles N. of*

the Chánda Nángi mountain 11,574 ft. Schl., Herm.

= 397 ft. below the Chánda Nángi mountain; by aneroid.

No. 159. YÁLLUNG RIVER, $27^{\circ} 36'$; $88^{\circ} 1'$, in Eastern Nepál, an affluent of the Támbur.

No. 164. HIMÁKOLI SPRINGS, $27^{\circ} 12'$; $87^{\circ} 59'$, in Sikkim, on the Singhalila ridge.

Loc. *Southern outlet of the group of springs* 11,250 ft. Schl., Herm.

Referred to Fálút peak by triangulation.

No. 165. FÁLÚT, or SINGHALÍLA PEAK, $27^{\circ} 13'·7$; $87^{\circ} 59'·8\frac{1}{2}$, in Sikkim, on the Singhalila range.

Loc. 1) *Top of the peak* 12,042 ft. G. T. S.

I (Hermann) lived in a tent near the top of this peak during three weeks, while occupied with physical observations and trigonometrical measurements of the snowy range. For the height of Fálút we adopted the value of the G. T. S. My tent was pitched at an elevation of 11,838 ft. above the sea (see p. 56). Fálút also served as a station for eliminating the errors depending on the season's corrections for these regions. (See p. 57.)

In the materials communicated to us by the G. T. S. we find another peak mentioned at a distance of only a mile to the north-west; its height, also contained in Dr. Hooker's map, is 12,329 ft. This height, however, seems to refer to a much more westerly peak. We had no peak dominating Fálút immediately on our left: compare the panorama of the eastern Himaláya in the Atlas. The latitude and longitude given above are determined trigonometrically by us; the numerous peaks so well defined and so distant from each other, as Kanchinjanga, Pandim, and Nársingh, etc., allowed us not only to

deduce from our trigonometrical angles the latitude and longitude of Fálút, but they offered also a very valuable control for the height of Fálút which we had adopted.

As one of our principal panoramas is made from this peak, we think it advisable to give exceptionally some details of our trigonometrical measurements. Introducing for Tónglo and Fálút, the geographical co-ordinates given above, we obtain, assuming for the refraction $\frac{1}{18.2}$ of the contained arc, the following values:

Name of Peak.	Distance from Fálút in Feet.	Vertical Angle above Fálút.	Resulting Absolute Height in Feet.	Difference from the Measurements of the G. T. S. in Feet.
Kanchinjंगा . .	181,632	4 51 10	28,123	- - 33
Pandim	146,045	3 44 0	22,003	- 14
Nársingh	137,808	2 49 20	19,223	+ 84

These values perfectly corroborate the distances introduced in the calculation, and in consequence the geographical co-ordinates we had obtained for Fálút.

Loc. 2) *Fálút peak at the southern end of the ridge, with our magnetic tent, close to Chang-tábu.*

The astronomical determination of this point gave (see Vol. I. p. 190) 27° 6' 20"; Long. E. Gr. 87° 59' 0". The height was not separately determined, the point being nearly on a level with *locality 1.*; we therefore adopted 12,042 ft. as the 3rd geographical co-ordinate, in preference to deducing it from a few isolated barometrical readings.

Loc. 3) *Deepest point of the Singhalíla ridge between the southern and northern Fálút peaks.* 11,182 ft. Schl., Herm.

„ 4) *Secondary elevation on the Singhalíla ridge.* 11,498 „ Schl., Herm.

This point is 3 miles S. of the principal or northern summit, referred by triangulation to the Fálút peak. It was my last encamping place before Tónglo, 1855, May 18th to 19th.

Loc. 5) *Singhalíla ridge at the base of Loc. 3 to the south* 11,354 ft. Schl., Herm.

„ 6) *ditto to the north* 11,415 „ Schl., Herm.

The value gives at the same time the average height of the crest to the south and to the north of it.

Loc. 7) *Southern base of the cone of Fálút* 11,778 „ Hook.

„ 8) *Spring on the south side of Fálút peak.* 1,956 ft. Schl., Herm.

= 86 ft. below the summit; by aneroid.

The water was remarkably plentiful, considering the short distance of the spring from the top.

In the immediate environs of the summit of Fálút, we had also determined the following points:

- Loc. 9) *Spring in a ravine on the eastern slope of Fálút* . 11,749 ft. Schl., Herm.
 = 293 ft. below the summit; by aneroid.
- „ 10) *Snow-bed about 20 feet long and 4 feet broad* . . . 11,490 „ Schl., Herm.
 = 552 ft. below the summit; by aneroid.

It was reported to me by a bhísti (water-carrier), who never had seen snow before, as “an immense hail-stone”. See details about similar mistakes, of frequent occurrence in these parts, in the volumes of Meteorology.

- Loc. 11) *Upper limit of “Coelogyne Wallichii” and “Tarus”* 10,000 ft. Hook

No. 166. KAMBOCHÉN, OR NÁNGO PASS, $27^{\circ} 42'$; $87^{\circ} 59'$, in Sikkim. W. of the monastery Tassichúding, leading from the Kambochén into the Yángma valley.

- Loc. 1) *Top of the pass* 15,770 ft. Hook
- „ 2) *Foot of the pass* 11,627 „ Hook.
- „ 3) *Kambochén village* 11,378 „ Hook.
- „ 4) *Valley near the village* 11,484 „ Hook.
- „ 5) *Beds of perpetual snow* 15,000 „ Hook
- „ 6) *Upper limit of dwarf juniper* 13,500 „ Hook

The depression of this pass is visible in the Fálút panorama. Schl., Herm

Loc. *Camp on the right bank of the river* 3,782 ft. Hook.

No. 175. YANGYADÍNG, $27^{\circ} 20'$; $87^{\circ} 54'$, in Eastern Nepál, a village 7 miles distant from the left bank of the Támbur 4,113 ft. Hook.

No. 176. PÉMMI RIVER, $27^{\circ} 9'$; $87^{\circ} 53'$, in Eastern Nepál, 8 miles E. of its junction with the Támbur in a straight line 2,205 ft. Hook.

No. 177. SABLÁKO, $27^{\circ} 18'$; $87^{\circ} 53'$, in Eastern Nepál, on a ridge separating the Khábili from the southern affluent of the Pángra. 4,676 ft. Hook.

No. 178. SIDÍNGBA RIDGE, $27^{\circ} 20'$; $87^{\circ} 53'$, in Eastern Nepál, end of the spur on the right bank of the Íva 6,018 ft. Hook.

No. 179. SANKIATSÁNG RIDGE, $27^{\circ} 4'$; $87^{\circ} 52'$, in Eastern Nepál, descending from Fálút, first in a westerly, then in a southerly direction.

Loc. 1) *Camp on ridge of the mountain* 8,353 ft. Hook.

„ 2) *One of the prominent peaks in the southern part of the ridge* 9,322 „ Hook.

No. 180. YÁNGMA PEAK, $27^{\circ} 55'$; $87^{\circ} 52'$, on the Nepál-Tibet frontier, on the eastern side of the Yángma pass.

Loc. *Top of the western peak* ab. 26,000 ft. Schl., Herm.

The height could only be taken approximatively, as the observations were repeatedly interrupted by fogs.

The depression of the *Yángma pass* is visible on the Fálút panorama to the left of the peak. To the right a *steep angular peak* became visible at some distance behind the ridge, $1^{\circ} 9'$ to the east of the preceeding one. But as neither the view from Tónglo, nor from Síchal, allowed me to find out this peak again, its distance and height could not be ascertained. I was told it was a peak standing out from the slope descending towards Tashirúkpa, on the Árong river; its position in the view favoured the presumption, that it was not very distant from the crest.

For the Kanglachén mountain, which is the next great elevation east of the Yángma pass, no height was taken. Schl., Herm.

No. 181. YÁNGMA, $27^{\circ} 51'$; $87^{\circ} 51'$, in Eastern Nepál, a village on the foot of the Yángma pass.

Loc. 1) *Mean height of the village* 13,502 ft. Hook.

„ 2) *Lake bed in valley* 15,186 „ Hook.

„ 3) *Upper lake bed* 16,038 „ Hook.

No. 182. TAPTÍATÓK, $27^{\circ} 29'$; $87^{\circ} 50'$, in Eastern Nepál, a village on the left bank of the Támbur, 7 miles below its junction with the Kambochén . . . 4,283 ft. Hook.

No. 183. TÁMBUR RIVER, $27^{\circ} 20'$; $87^{\circ} 49'$, in Eastern Nepál, 27 miles below the junction of the Vállanchun and Yángma 2,544 ft. Hook.

No. 184. TÁMBUR RIVER, $27^{\circ} 26'$; $87^{\circ} 49'$, in Eastern Nepál, 20 miles S. of the junction of the Vállanchún and Yángma. 3,201 ft. Hook.

No. 185. LÚNGTUNG, $27^{\circ} 39'$; $87^{\circ} 47'$, in Eastern Nepál, a village on the right bank of the Támbur, 2 miles above its junction with the Kambochén . . . 5,676 ft. Hook.

No. 192. TÁMBUR RIVER, $27^{\circ} 37'$; $87^{\circ} 45'$, in Eastern Nepál, 3 miles below the junction of the Vallanchún and Yángma 8,081 ft. Hook.

No. 193. MÍVA GUÓLA, $27^{\circ} 20'$; $87^{\circ} 44'$, in Eastern Nepál, a village on the right bank of the Támbar. 2,132 ft. Hook.

No. 194. VALLANCHÚN, $27^{\circ} 43'$; $87^{\circ} 44'$, in Eastern Nepál, a village on the left bank of the Vallanchún 10,386 ft. Hook.

No. 195. Δ TÁKVRÓMA, $27^{\circ} 45'$; $87^{\circ} 42'$, in Eastern Nepál, a halting place on the left bank of the Vallanchún, on the way to the Vallanchún pass.

Loc. Rocky terrace above the river 12,944 ft. Hook.

No. 196. VALLANCHÚN PASS, $27^{\circ} 58'$; $87^{\circ} 41'$, in Eastern Nepál, leading from the Támbar into the Árun valley.

Loc. 1) Top of the pass 16,756 ft. Hook.

„ 2) Foot of the pass 13,509 „ Hook.

„ 3) Limit of perpetual snow 15,000 „ Hook.

In the Fäldt panorama the pass is represented by a broad interruption of the snowy range, though the pass itself is scarcely visible. Schl., Herm.

NO. 197. LANGÚR PEAK, $28^{\circ} 56'$; $87^{\circ} 22'$, in Tibet, on the northern slope of the Langúr range, where it forms the boundary between the Tíngri province and the Dihóng valley.

Loc. *Top of the peak* ab. 24,660 ft. Schl., Res. O.¹

In the Fálút panorama this peak is not visible, being more than 60 miles distant from the Vallanchún pass. The height which I obtained in the Kathmándu Residency is based, I was told, on angles, though very small ones, of the G. T. S. The name of the range and the mountain is the Hindu name in use at Kathmándu, and was communicated to me by Jhāng Bahádur.

The name of Langúr, or Bänder, "monkey," is in combination with Hindu mythological ideas not unfrequently met with in the geographical terminology of the snowy ranges. Schl., Herm.

NO. 198. SÍHSUR PEAK (No. XIII. †), $27^{\circ} 53' 4''$; $87^{\circ} 4' 5''$, in Nepál, at the southern end of a spur descending from the Pakángolo crest 27,799 ft. G. T. S.

In the Fálút panorama also the crest N. of the village Pakángolo is seen, and is marked by three peaks of nearly equal apparent height. Schl., Herm.

NO. 199. CHAMLÁNG PEAK No. XIV. †, $27^{\circ} 46' 5''$; $86^{\circ} 58' 0''$, in Nepál, S. of Gaurisáňkar, on the right bank of the Arun, or Tamkósi 24,020 ft. G. T. S.

On the Fálút panorama close to the left of the Gaurisáňkar peak. Schl., Herm.

NO. 200. GAURISÁŇKAR, OR MOUNT EVEREST (No. XV. †), $27^{\circ} 59' 3''$; $86^{\circ} 54' 7''$, on the Nepál-Tíbet frontier 29,002 ft. G. T. S.

This is the highest mountain of our globe as yet measured. I saw it first from the Singhalila range, when its isolated prominent form (see plate No. 1. of the first part of our Atlas) at once signalized it as a rival of Kanchinjínga, and numerous angular heights and distances were taken. The measurements of the G. T. S. were only published in 1855, Dec. 18, and Sir Andrew Waugh had the kindness, a short time afterwards, to communicate to us, in a direct letter, the results obtained. The mean result of our measurements gives its absolute height nearly 200 feet higher (29,196 ft.), than that of the G. T. S., but the distance exceeded 84 miles; as the angles of the G. T. S. were taken from numerous and varied points, we adopt their result as the final one.

The Hindu name I found, when later in Nepál, to be Gaurisáňkar, Gauri = white, or fair, a name of Párvati, the wife of Shíva; Sáňkar, or Sáňkara, one of the forms assumed by Shíva. Gaurisáňkar is the term in use among the Hindu Pándits of Nepál; its signification shows a remarkable identity with the meaning of the name Chamalhári, the prominent object of western Bhután. The name given to Gaurisáňkar by the Tibetans, and that by which it is generally known in the northernmost parts of Nepál, is "Chingopāmarí."

In the Káulia panorama Gaurisáňkar is also visible; it is there the most eastern peak in the snowy range. Schl., Herm.

¹ Information received by various British Residents in Nepál is marked "Schl., Res. O."

No. 201. CHAMLÁNG PEAK No. XVI. \oint , $27^{\circ} 45' \cdot 3$; $86^{\circ} 48' \cdot 6$, in Nepál, about 5 miles E. of the ridge descending from the Gaurisáňkar peak 22,215 ft. G. T. S.

In the Fálút panorama, this peak is the last well defined object to the west. Schl., Herm.

Nos. 202-6. SANKÓSI PEAKS, in Nepál.

Lat. N. $27^{\circ} 45' \cdot 3$ to $27^{\circ} 57' \cdot 5$; Long. E. Gr. $86^{\circ} 33' \cdot 5$ to $86^{\circ} 5' \cdot 5$.

The view of the snowy range from the Singhalíla ridge included, besides, peaks that were nearly a degree farther to the west; as, however, the summits did not present aspects sufficiently varied for a minute analysis of detail, we limit ourselves to giving the geographical co-ordinates, as determined by the G. T. S. From the river system into which their glaciers discharge themselves, we give the peaks the general name of Sankósi. They are also visible in the Káulia panorama, the most western of them presenting from Kathmándu a very high, sharp point, occasionally called "Needle peak" in the Residency.

No. 202. SANKÓSI PEAK No. XVII. \oint , $27^{\circ} 45' \cdot 3$; $86^{\circ} 33' \cdot 5$. 22,826 ft. G. T. S.

No. 203. SANKÓSI PEAK No. XVIII. \oint , $27^{\circ} 52' \cdot 8$; $86^{\circ} 28' \cdot 5$. 21,987 ft. G. T. S.

No. 204. SANKÓSI PEAK No. XIX. \oint , $27^{\circ} 58' \cdot 3$; $86^{\circ} 25' \cdot 1$. 23,570 ft. G. T. S.

No. 205. SANKÓSI PEAK No. XX. \oint , $27^{\circ} 57' \cdot 8$; $86^{\circ} 18' \cdot 3$. 23,447 ft. G. T. S.

No. 206. SANKÓSI PEAK No. XXI. \oint , $27^{\circ} 57' \cdot 5$; $86^{\circ} 5' \cdot 5$. 19,560 ft. G. T. S.

Nos. 207-9. JIBJÍBIA PEAKS, in Nepál.

No. 207. JIBJÍBIA EAST PEAK No. XXII. \oint , $28^{\circ} 7' \cdot 7$; $85^{\circ} 51' \cdot 3$.

21,853 ft. G. T. S.

In the Káulia panorama, this is the first prominent object, and on account of its comparatively short distance, appears to be of considerable height. It stands in the Kerántis' country. From the environs of Kathmándu two peaks are seen as gemini, very close to each other. Compare Nepál panorama from Káulia. Schl., Herm.

No. 208. JIBJÍBIA CENTRAL PEAK No. XXIV. \oint , $28^{\circ} 10' \cdot 4$; $85^{\circ} 45' \cdot 9$.

22,891 ft. G. T. S.

The mountain ridge Jibjibia connects this peak with Shupúri. See the Káulia panorama.
Schl., Herm.

No. 209. JIBJÍBIA NORTH PEAK No. XXIII. $\frac{1}{2}$, $28^{\circ} 21' 1''$; $85^{\circ} 46' 0''$

26,306 ft. G. T. S.

It is not visible in the Káulia panorama. In a direction to the west of the bearing I saw an apparently high snow-clad mountain; but it was, as my subsequent triangulation showed, only one of the numerous minor peaks of the Jibjibia ridge, and comparatively not very distant.

Schl., Herm.

No. 210. DAIBÚNG PEAK (No. XXV. $\frac{1}{2}$), $28^{\circ} 15' 4''$; $85^{\circ} 30' 2''$, in Nepál.

23,762 ft. G. T. S.

Visible in the Káulia panorama, just rising above the left slope of the Jibjibia ridge; it is about equally distant from the latter crest and from the Trissulgánga. Schl., Herm.

No. 211. FULSHÓK MOUNTAIN, $27^{\circ} 34'$; $85^{\circ} 20'$, in Nepál, S.E. of Kathmándu.

Loc. *Top of the peak* 9,750 ft. Schl., Herm.

Deduced from trigonometrical measurements from Káulia and Chandragiri.

No. 212. SHUPÚRI MOUNTAIN, $27^{\circ} 49'$; $85^{\circ} 19'$, in Nepál, a ridge in a meridional direction, N.N.E. of Kathmándu 8,545 ft. Schl., Herm.

Deduced from trigonometrical measurements from Káulia and Chandragiri. In the Káulia panorama it would be seen towering the western slope of Kákani, if continued to the east.

Schl., Herm.

No. 213. FÍRFING, $27^{\circ} 39'$; $85^{\circ} 15'$, in Nepál, a village S.E. of Kathmándu.

No. 217. KÁRBU, $27^{\circ} 35'$; $85^{\circ} 12'$, in Nepál, a village S. of Kathmándu, on the eastern road from Kathmándu to Kulikhána.

Loc. 1) *Ruins of a fort* 5,842 ft. Schl., Herm.

10, Pistor. 1857, March 10, 6^h 45^m P.M. A. 24 260; 14 1; 100. Calcutta 29 914; 67 3; 92.

Loc. 2) *Mean height of the village* 5,734 ft. Schl., Herm.

= 108 ft. below the fort; by aneroid.

" 3) *Level of the river* 4,981 ft. Schl., Herm.

= 753 ft. below the village; by aneroid.

" 4) *Betel palm in a garden* 5,820 ft. Schl., Herm.

= 22 ft. below the fort; directly measured.

The locality of this palm is one of the highest in the environs.

No. 218. MARIBÚ, $27^{\circ} 45'$; $85^{\circ} 11'$, in Nepál, a village N. of Kathmándu, near Dharamtháli.

Loc. *Mean height of the village* 4,680 ft. Schl., Herm.

By trigonometrical determination from the base line near the Residency at Kathmándu.

No. 219. CHÁMPA DÉVI, $27^{\circ} 38'$; $85^{\circ} 10'$, in Nepál, a peak E. of Chandragiri.

Loc. *Temple on the top of the mountain* 7,320 ft. Schl., Herm.

By trigonometrical determination from the base line near the Residency at Kathmándu.

No. 220. MAHARÁNI-KA-PÁUA, $27^{\circ} 50'$; $85^{\circ} 10'$, in Nepál, a sarái for travellers, on the road from Kathmándu to Noakót, viâ Borbándi crest.

Loc. *Highest point of the road where it leads over the western*

slopes of Kákani mountain 6,586 ft. Schl., Herm.

9, Pistor. 1857, Feb. 28, 4^h 5^m P.M. A. 23·603; 58·3; 74. Calcutta 29·718; 88·3; 54. — 66 = 6,605 ft.
Pátua 29·556; 83·9; 45. — 64 = 6,566 ft.

No. 221. KÁULIA MOUNTAIN, $27^{\circ} 47'$; $85^{\circ} 9'$, in Nepál, N. of Kathmándu, the capital of Nepál 6,977 ft. Schl., Herm.

9, Pistor. 1857, March 1, 4^h P.M. A. 23·339; 63·9; 60. Calcutta 29·749; 88·9; 30. — 70 = 6,988 ft.
Pátua 29·627; 76·9; 47. — 68 = 6,932 ft.

By trigonometrical determination from the base line near the Residency the height was found to be 7,011 ft. We take the mean of the barometrical and trigonometrical values.

A large panorama was drawn by Hermann from the Káulia mountain (see panoramic profiles pp. 264 and 265).

No. 222. NAGÁRCHUN, $27^{\circ} 45'$; $85^{\circ} 7'$, in Nepál, a mountain N.W. of Kathmándu, in a rather isolated position 6,728 ft. Schl., Herm.

9, Pistor. 1857, Feb. 24, 2^h P.M. 23·552; 60·3; 77. Pátua 29 708; 75 1; 62. — 66.

Nos. 223-4. ÁKU PEAKS, in Nepál,

on a ridge, separating the Bóri-Gándak and the Áku rivers.

No. 223. ÁKU NORTH PEAK No. XXVI. †, $28^{\circ} 23' 5''$; $85^{\circ} 6' 8''$. 24,313 ft. G. T. S.

No. 224. ÁKU SOUTH PEAK No. XXVII. †, $28^{\circ} 20' 7''$; $85^{\circ} 4' 0''$. 23,313 ft. G. T. S.

In the Káulia panorama the Áku north peak is not visible, the south peak alone being seen.

No. 225. THANKÓT, $27^{\circ} 41'$; $85^{\circ} 6' 5''$, in Nepál, a village on the Baghmátti, S.W. of Kathmándu, on the Chandragiri pass.

Loc. *The Súbah's house* 5,388 ft. Schl., Herm.

10, Pistor. 1857, March 6, 3^h 45^m P.M. A. 24·804; 62·6; 70. Calcutta 29·890; 90·3; 60. — 53 ft.

No. 226. CHANDRAGÍRI RIDGE, $27^{\circ} 40'$; $85^{\circ} 3'$, in Nepál, crossed on the road from Kulikhána to Thankót.

Loc. 1) *Highest peak W. of the pass* 7,499 ft. Schl., Herm.

10, Pistor. 1857, March 6, 11^h 30^m A.M. Loc. Corr. — 107 ft.

A. 23·013; 64·6; 45. Calcutta 29·910; 85·6; 40. — 75 = 7,526 ft. Pátua 29·766; 77·6; 82. — 73 = 7,472 ft.

Loc. 2) *Chandragíri pass* 7,242 ft. Schl., Herm.

= 257 ft. below the peak; trigonometrically measured.

No. 227. KUMHÁRI PASS, $27^{\circ} 50'$; $85^{\circ} 3'$, in Nepál, S. of Noakót, leading to Noakót over a spur branching from the Birbándi ridge ab. 5,900 ft. Schl., Res. O.

No. 228. KULIKHÁNA, $27^{\circ} 36'$; $85^{\circ} 2'$, in Nepál, on the Pínáni, with large elephant sheds.

Loc. *Mean height of the village* 4,576 ft. Schl., Herm.

10, Pistor. 1857, March 11, 1^h 15^m P.M. A. 25·473; 63·3; 30. Calcutta 29·901; 77·7; 50. — 46 = 4,557 ft.
Pátua 29·820; 70·3; 46. — 45 = 4,595 ft.

No. 229. CHITLÓNG, $27^{\circ} 39'$; $85^{\circ} 2'$, in Nepál, a village on the road from Kulikhána to Noakót, which passes over the western continuation of the Chandragíri mountain.

Loc. 1) *Mean height of the village* 4,830 ft. Schl., Res. O.

„ 2) *Dína Bíási pass, N. of Chitlóng* ab. 8,000 „ Schl., Res. O.

It seems to exceed in height Chandragíri pass; my information is derived from natives, who were unable to give any positive data in reference to its height.

Loc. 3) *Southern foot of the Dína Bíási pass in the Dína*

Bíási valley 3,650 ft. Schl., Res. O.

No. 230. \triangle MARKOPÁUA, $27^{\circ} 37'$; $85^{\circ} 1'$, in Nepál, a halting place on the way from Kulikhána to the Chandragíri pass.

Loc. *Government shed* 4,850 ft. Schl., Herm.

= 274 ft. above Kulikhána; by aneroid.

No. 231. KALPÚ RIVER, $27^{\circ} 47'$; $85^{\circ} 1'$, in Nepál, S. of Dárkia, at the crossing of the Noakót road.

Loc. *Level of the river* 3,680 ft. Schl., Res. O.

No. 232. TAMBÁKHÁNA, $27^{\circ} 36'$; $85^{\circ} 0'$, in Nepál, at the northern foot of the Sissagárh pass 4,455 ft. Schl., Res. O.

No. 233. **SISSAGÁRH PASS**, $27^{\circ} 35'$; $84^{\circ} 59'$, in Nepál, with a fort, dominating the route to Kathmándu, above Bhimpédi 6,414 ft. Schl., Herm.

9, Pistor. 1857, Feb. 17, 12^h Noop. A. 23·886; 58·6; 75. Calcutta 29·945; 83·5; 62. — 64 = 6,435 ft.
Pátua 29·809; 72·2; 68. — 62 = 6,393 ft.

No. 234. **CHISAPÁNI**, $27^{\circ} 38'$; $84^{\circ} 59'$, in Nepál, at the southern slope of the Sissagárh pass 5,430 ft. Schl., Res. O.

No. 235. **BHIMPÉDI**, $27^{\circ} 33'$; $84^{\circ} 58'$, in Nepál, at the northern foot of the Chandragiri pass 3,644 ft. Schl., Herm.

9, Pistor. 1857, Feb. 17, 9^h 30^m A.M. A. 26·378; 53·2; 86. Calcutta 29·971; 78·1; 80 = 3,644 ft.
Pátua 29·844; 70·2; 75 = 3,644 ft.

No. 236. **NOAKÓT**, $28^{\circ} 0'$; $84^{\circ} 58'$, in Nepál, on the left side of the Trissulgánga valley.

Loc. *Level of the river* 1,641 ft. Schl., Herm.

= 250 ft. above Hetáunda; by aneroid.

No. 237. **HETÁUNDA**, $27^{\circ} 26'$; $84^{\circ} 52'$, in Nepál, a fortified village on the left bank of the Rápti, in the Tarái, with elephant sheds.

Loc. 1) *Mean height of the village* 1,391 ft. Schl., Herm.

9, Pistor. 1857, Feb. 16, 6^h P.M. A. 28·457; 59·5; 91. Calcutta 29·864; 77·0; 84. — 0 = 1,387 ft.
10, Pistor. „ March 12, 2^h „ „ 28·536; 78·8; 74. „ 29·944; 79·9; 71. — 27 = 1,386 „
Pátua 29·809; 71·7; 69. — 25 = 1,401.

Loc. 2) \triangle *Makvanpúra, a halting station, S. of Hetáunda* . . 1,367 ft. Schl., Herm.

= 24 ft. below Hetáunda; by aneroid.

No. 238. **CHÍRIA GHÁT (pass)**, $27^{\circ} 21'$; $84^{\circ} 50'$, in Nepál, leading over the south-western end of the Chiria ghāt range 2,262 ft. Schl., Herm.

9, Pistor. 1857, March 12, 4^h 30^m P.M. A. 27·678; 70·9; 80. Calcutta 29·903; 81·3; 80 = 2,260 ft.
Pátua 29·771; 72·8; 76 = 2,263 ft.

The Chiria ghāt range is a part of the line of sandstone hills which are met with all along the southern foot of the Himálaya. Schl., Herm.

Loc. 2) *Secondary pass, N. of the Chiria ghat* 1,632 ft. Schl., Herm.

9, Pistor. 1857, March 12, 2^h P.M. A. 28·327; 72·0; 75. Pátua 29·807; 71·7; 73.

No. 239. BÍCHIA KOH, $27^{\circ} 15'$; $84^{\circ} 50'$, in Nepál, at the centre of the Tarái, S. of Hetáunda.

Loc. 1) *Thanadár's house* 1,042 ft. Schl., Herm.

9, Pistor. 1857, Feb. 16, 10^h A.M. A. $28^{\circ} 957$; $70^{\circ} 0$; 60. Pátina $29^{\circ} 859$; $68^{\circ} 1$; 76.

Nos. 240-2. YÁSSA PEAKS, in Nepál.

No. 240. YÁSSA SOUTH PEAK No. XXVIII. \oint , $28^{\circ} 26' 0$; $84^{\circ} 37' 4$. 25,818 ft. G. T. S.

No. 241. YÁSSA CENTRAL PEAK No. XXIX. \oint , $28^{\circ} 30' 2$; $84^{\circ} 33' 1$. 25,729 ft. G. T. S.

No. 242. YÁSSA NORTH PEAK No. XXX. \oint , $28^{\circ} 33' 0$; $84^{\circ} 32' 7$. 26,680 ft. G. T. S.

The central peak is hidden in the panorama behind the eastern one.

The Yássa peaks are powerful prominences of a ridge between the Gándi and Darámbi rivers, and show very large snow-clad surfaces in the Káulia panorama. In consequence of their comparatively great difference of latitude, and of their relative position to the central point of the panorama, the peak farthest east is seen to the left. Schl., Herm.

Nos. 243-5. BARATHÓR PEAKS, in Nepál.

No. 243. BARATHÓR EAST PEAK No. XXXIII. \oint , $28^{\circ} 29' 4$; $84^{\circ} 10' 5$.
22,947 ft. G. T. S.

No. 244. BARATHÓR CENTRAL PEAK No. XXXIV. \oint , $28^{\circ} 32' 1$; $84^{\circ} 6' 4$.
26,069 ft. G. T. S.

No. 245. BARATHÓR WEST PEAK No. XXXV. \oint , $28^{\circ} 32' 2$; $84^{\circ} 4' 1$.
24,718 ft. G. T. S.

These peaks are not visible in the Káulia panorama, being concealed by the Pächsankóla ridge (= 500 rivers ridge). Barathór, I was told, signifies "Great Peaks," but it might also be referred to a shepherd's halting place of this name at their foot; in the latter case the meaning would be "very little, very barren." Not visible in the Káulia panorama, being concealed by the Pächsaukóla ridge.
Schl., Herm.

Nos. 246-51. MORSHÍÁDI PEAKS, in Neplá

Lat. N. $28^{\circ} 35' 0$ to $28^{\circ} 39' 3$. Long. E. Gr. $83^{\circ} 58' 5$ to $83^{\circ} 42' 9$.

No. 246. MORSHÍÁDI PEAK No. XXXVI. \oint , $28^{\circ} 35' 0$; $83^{\circ} 58' 5$. 24,780 ft. G. T. S.

No. 247. MORSHÍÁDI PEAK No. XXXVII. \oint , $28^{\circ} 29' 7$; $83^{\circ} 56' 0$. 22,964 ft. G. T. S.

No. 248. MORSHIÁDI PEAK No. XXXVIII. †, $28^{\circ} 29' \cdot 9$; $83^{\circ} 55' \cdot 9$. 22,986 ft. G. T. S.

No. 249. MORSHIÁDI PEAK No. XXXIX. †, $28^{\circ} 35' \cdot 7$; $83^{\circ} 48' \cdot 4$. 20,522 ft. G. T. S.

No. 250. MORSHIÁDI PEAK No. XL. †, $28^{\circ} 31' \cdot 1$; $83^{\circ} 47' \cdot 5$. 23,641 ft. G. T. S.

No. 251. MORSHIÁDI PEAK No. XLI. †, $28^{\circ} 39' \cdot 3$; $83^{\circ} 42' \cdot 9$. 22,471 ft. G. T. S.

I adopted for this group the name of the principal river which drains its glaciers; only one peak, No. XXXVII., is visible in the Káulia panorama, over the central part of the Páchsaukóla ridge. Schl., Herm.

No. 252. DHAVALAGÍRI, OR DHOLAGÍRI (No. XLII. †), $28^{\circ} 41' \cdot 8$; $83^{\circ} 28' \cdot 7$, in Nepál.
26,826 ft. G. T. S.

The most southern and eastern of the Narayáni group of snow peaks. The Narayáni river, which finds a way between these peaks from the northern part of the valley, where the inhabitants, climate, and scenery, are all Tibetan, is also called Saligrám river, from the numerous fossils (ammonites) which it carries down to the lower parts of Nepál. Dhavalagíri, one of the first Himálayan peaks of considerable elevation measured by Colonels Crawford and Colebroke,¹ was for a long time considered the highest mountain of the globe. In the Káulia panorama, its inclinations are not very steep. Schl., Herm.

NOS. 253-61. NARAYÁNI PEAKS, in Nepál.

Lat. N. $28^{\circ} 46' \cdot 0$ to $28^{\circ} 40' \cdot 0$. Long. E. Gr. $83^{\circ} 22' \cdot 4$ to $83^{\circ} 5' \cdot 0$.

No. 253. NARAYÁNI PEAK No. XLIII. †, $28^{\circ} 45' \cdot 8$; $83^{\circ} 22' \cdot 4$. 25,456 ft. G. T. S.

No. 254. NARAYÁNI PEAK No. XLIV. †, $28^{\circ} 45' \cdot 2$; $83^{\circ} 21' \cdot 8$. 25,299 ft. G. T. S.

No. 255. NARAYÁNI PEAK No. XLV. †, $28^{\circ} 44' \cdot 0$; $83^{\circ} 20' \cdot 9$. 24,912 ft. G. T. S.

No. 256. NARAYÁNI PEAK No. XLVI. †, $28^{\circ} 44' \cdot 1$; $83^{\circ} 17' \cdot 9$. 25,095 ft. G. T. S.

No. 257. NARAYÁNI PEAK No. XLVII. †, $28^{\circ} 40' \cdot 5$; $83^{\circ} 15' \cdot 7$. 23,565 ft. G. T. S.

No. 258. NARAYÁNI PEAK No. XLVIII. †, $28^{\circ} 43' \cdot 9$; $83^{\circ} 11' \cdot 7$. 24,181 ft. G. T. S.

¹ See the interesting memoir on the height of the Himálaya mountains, by H. T. Colebroke, in Vol. XII. of the Asiatic Researches.

No. 259. NARAYÁNI PEAK No. XLIX. \ddagger , $28^{\circ} 44' \cdot 9$; $83^{\circ} 7' \cdot 9$. 23,779 ft. G. T. S.

No. 260. MACHIPÚCHA, or NARAYÁNI PEAK No. L. \ddagger , $28^{\circ} 44' \cdot 6$; $83^{\circ} 6' \cdot 1$.
21,727 ft. G. T. S.

No. 261. NARAYÁNI PEAK No. LI. \ddagger , $28^{\circ} 46' \cdot 0$; $83^{\circ} 5' \cdot 0$. 21,472 ft. G. T. S.

This group is situated in the western part of the snowy ridge which is seen in the Káulia panorama; its angular height is still very considerable. Owing to the steepness of its flanks, Machipúcha is a particularly well defined object. Schl., Herm.

No. 262. CHAUBÍSSI PEAK (No. LII. \ddagger), $28^{\circ} 49' \cdot 7$; $82^{\circ} 36' \cdot 1$, in Nepál, E. of the ridge which forms the western frontier of the Saptgándaki province of Nepál 19,415 ft. G. T. S.

Visible as the last snowy peak to the west in the Káulia panorama. Schl., Herm.

No. 263. ÁPI PEAK, $30^{\circ} 0'$; $80^{\circ} 57'$, in Nepál, E. of the Káli and S.W. of the Yári pass 22,799 ft. Webb.

Webb, who marks this peak XXIII, gives Lat. N. $29^{\circ} 59' \cdot 33$; Long. E. Gr. $80^{\circ} 44'$. The values we adopt are from Major Thuillier's "Map of Nepál. Calcutta, 1855." Schl., Rob.

This peak is visible in the Chíner panorama.

No. 264. BIÁNS RÍKHI PEAK, $30^{\circ} 10'$; $80^{\circ} 54'$, in Nepál, E. of the Káli.
19,929 ft. I. A. 66.

Not distinctly visible in the Chíner panorama. Schl., Ad.

Nos. 265-6. KUNLÁS PEAKS, in Nepál, E. of the Káli.

No. 265. KUNLÁS EAST PEAK, $30^{\circ} 13'$; $80^{\circ} 54'$. . . 21,669 ft. I. A. 66.

No. 266. KUNLÁS WEST PEAK, $30^{\circ} 13'$; $80^{\circ} 53'$. . . 22,513 ft. I. A. 66.

In the Chíner panorama the Kunlás peaks are prominences of comparatively little height, on account of their considerable distance. Schl., Ad.

No. 267. KURTÉKH PEAK, $30^{\circ} 8'$; $80^{\circ} 51'$, in Nepál, near the left bank of the Káli.
Loc., *Top of the peak* 15,817 ft. I. A. 66.

No. 268. RAULAKÓT, $29^{\circ} 36'$; $80^{\circ} 32'$, in Nepál, E. of the Káli.

Loc. *Fort* 8,363 ft. I. A. 66.

No. 269. CHARALÉKH, $29^{\circ} 36'$; $80^{\circ} 26'$, in Nepál, 3 miles E. of the Káli.

Loc. *Mean height of the village* 6,616 ft. I. A. 66.

No. 270. GÖL LÉKH MOUNTAIN, $29^{\circ} 29'$; $80^{\circ} 24'$, in Népal, 3 miles E. of the Káli.

Loc. *Top of the mountain* 8,267 ft. Webb.

AREA VIII.

WESTERN HIMÁLAYA, FROM KĀMÁON TO HAZÁRA.

Diagonal, from south-east to north-west: Almóra viâ Sínla and Srinágger to Rajáur.

The geographical provinces of this area, the western termination of which we consider at the same time as the end of the Himálaya, are the following:

1. Kāmāon,	5. Chām̄ba,	9. Kishtvár,
2. Gār̄hvāl,	6. Jāmu,	10. Kashmír,
3. Sínla,	7. Rajáuri,	11. Mārri.
4. Kūlu,	8. Lahól,	

Notwithstanding its great extent, and the variety of its physical features, the hypsometrical details¹ are more numerous and complete than for the Eastern Himálaya. Not only were some of the provinces of this area, as Kāmāon and Gār̄hvāl, among the very first explored by Europeans, but they were also easier of access, parts of them, as early as 1817, having become subject to British rule.

The compilation of the heights situated in this area, proved to be one of the most laborious tasks in the working out of the present volume; at first it seemed scarcely possible to decide with any certainty upon the original observer. In most cases, the heights already to be found in various books are quoted without the name of the authority upon which they are based; and it was only by carefully tracing back the determinations to their very earliest sources, that we were finally enabled to assign them to the right persons. Wherever one place has been determined by various observers, we have given the result obtained by each,² though, from the nature of the instruments at their disposal, it is no matter for surprise, that discrepancies, sometimes of considerable magnitude, frequently occur.

¹ An enumeration of the various materials is given pp. 8 and 9.

² In the *Journal of the Royal Geographical Society of London*, 1834, Vol. IV. p. 376, et seq., Capt. Webb gives a list of places determined by him, all of which we could not embody, as he omits to state which of the various results obtained by him for the same places he considers as the final one.

A great many of the peaks situated within this area have been recently determined by the Great Trigonometrical Survey, and we trust that we have been successful in our endeavours to identify them with those previously fixed by other observers, this being a point of some importance for the geographer.

The values of latitudes and longitudes, as formerly laid down by Herbert and Hodgson, agree in general to a remarkable extent with those of the G. T. S.; but as these officers had scarcely any opportunity for taking *reciprocal*, and none whatever for obtaining *simultaneous* observations of the refraction,¹ their heights are somewhat at variance with the more recent determinations of the latter.

With reference to the general hypsometrical condition of this extensive area, it is worth mentioning, that none of the peaks attain so stupendous an elevation as that of Gaurisáňkar, Dápsang, or Kanchinjंगा; the highest peak, the Nánda Dévi, being 25,749 feet high (3,253 feet less than Gaurisáňkar). The peaks above 23,000 feet in height are only few in number, though the passes, particularly those leading to Tíbet, are scarcely less elevated than the most considerable in the Eastern Himálaya. As a remarkable pass may be mentioned the Íbi Gámin pass, 20,459 feet high, the highest we ever had occasion to cross. Though known to the natives of the Mána and Bádrinath villages, some of whose inhabitants ventured to cross it about 36 years ago, the pass was found to be so difficult of access, that its uselessness as a commercial route at once became apparent.²

Throughout the Himálaya, the valleys, with the exception of some few lacustrine basins, now drained off, as Kashmír and Kathmándu, are narrow and steep in their lower part, the powerful erosion of the rivers having materially modified their forms. The villages also are in most cases built considerably above the level of the river, sometimes on terraces remaining within the eroded channel, but more generally upon the slopes above the erosion. Wherever it was possible, we endeavoured to ascertain the relative height of the village above the river.

Four panoramas, taken respectively from the Chínér near Nainítál, from the Kidarkánta in Gárhvál, from the Jáko near Símra, and from the Nunevára in Kashmír, will, we hope, materially assist the reader in better defining the hypsometrical character of this area.

¹ Simultaneous observations were first taken, as far as we know, by Sir George Everest, the late well known Surveyor General of India.

No. 83. \triangle DVĀLI, $30^{\circ} 11'$; $79^{\circ} 49'$, in Kāmāon, on the right bank of the Kāfini, in its upper part.

Loc. 1) *Level of the Kāfini* 8,674 ft. Schl., Ad.

6, Adie. May 29, 9^h A.M. A. 22·028; 63·3; 10. Banóg 22·926; 67·1; 18.

„ 2) *Conflux of the Pīndari and Kāfini below \triangle Dvāli* ab. 8,200 ft. Strach.

No. 84. NĀNDA DÉVI PEAK, $30^{\circ} 29' \cdot 9$; $79^{\circ} 48' \cdot 7$ P, in Kāmāon, the highest peak of this province, S.W. of Mīlum, the principal place of northern Kāmāon.

Loc. *Top of the peak* 25,749 ft. Herb. and Hodg.

„ *ditto* 25,741 „ Webb.

This is the same peak which has been usually called Jawahir; but Jawahir, properly Johár, is the name of the district in which the peak is situated.

Nānda Dévi forms a prominent massif, to be seen from many parts of the Himālaya and Tibet.

Captain Webb, who also had occasion to measure this peak, gives to it the designation “No. XIV.”; Herbert and Hodgson name it “A. No. 2.”

The geographical co-ordinates determined by these observers are:

Webb $30^{\circ} 21' 52''$ Lat. N.; $79^{\circ} 48' 40''$ Long. E. Gr.

Hodgson $30^{\circ} 22' 19''$ „ „ $79^{\circ} 57' 22''$ „ „

It is the central and most prominent object of the Chīner panorama. Schl., Ad.

No. 85. TRAILL'S, or NĀNDA KHAT PASS, $30^{\circ} 13'$; $79^{\circ} 48'$, in Kāmāon, leading from the Pīndari to the Góri valley.

In the environs there were large patches covered with grass. The excursion to the Kidarnath glacier was chiefly made in order to discover a pass which would lead directly from Kidarnath to

Gangótri. The pass was said to have been crossed some 30 years ago; but now (1855) the glacier was so much crevassed, as to render the transit impossible. (See Ritter's *Erdkunde*, Vol. III., pp. 938, 946. Schl., Rob.

Nos. 203-4. SHÍPPUR PEAKS, in Gärhvál, E. of Gangótri on the Bhagirátti.

No. 203. SHÍPPUR EAST PEAK, $31^{\circ} 0' \cdot 8$; $79^{\circ} 3' \cdot 4 \frac{1}{2}$. 22,076 ft. G. T. S.

No. 204. SHÍPPUR WEST PEAK, $31^{\circ} 2' \cdot 5$; $78^{\circ} 59' \cdot 6 \frac{1}{2}$. 20,933 ft. G. T. S.

These peaks are not visible in the Chínér panorama; they are, however, contained in the respective hypsometrical diagram. Schl., Ad.

No. 205. KÍDARNATH, or MAHAPANTH PEAK ($a \frac{1}{2}$), $30^{\circ} 47' \cdot 9$; $79^{\circ} 3' \cdot 2$, in Gärhvál, N. of Kídarnath, a Hindu temple on the Mandágni 22,840 ft. G. T. S.

It is situated near the western extremity of the Chínér panorama, and is also visible in the Kidarkánta panorama. In the latter it presents itself under a much greater angle, being considerably less distant from the observer. Schl., Ad.

No. 339. NEVÁDA, $30^{\circ} 15'$; $78^{\circ} 3'$, in Gārhwál, S. of Déra, in the Déra Dūn.

Loc. *Mean height of the village* 2,364 ft. Herb. and Hodgs.

No. 340. GRACEMOUNT, $30^{\circ} 27' 6''$; $78^{\circ} 3' 0''$, in Gārhwál, near the sanitarium of Mässúri.

Loc. 1) *Cistern of General Sir Andrew Waugh's barometer* . . 6,590 ft. G. T. S.

„ 2) *Cistern of the barometer at Mary Villa, near Grace-
mount* 6,715 ft. G. T. S.

Dec. 8, 9^h A.M. A. 23·631; 46·6; 59. B. 23·739; 48·0; 66·0 = 6,716 ft. | B = Gracemount.

„ 9, 9 „ „ 23·618; 53·7; 67. „ 23·725; 53·4; 58·0 = 6,714 „ | Observer: Mr. Hennesser.

The following mountains and points in the environs of Mässúri, determined by the Great Trigonom-
metrical Survey of India, were kindly communicated to us by General Sir Andrew Waugh.

A. MOUNTAINS.

B. POINTS.

Hatipám 7,109 ft.	Himálaya Club House 6,849 ft.	Mässúri Seminary 6,330 ft.
Edge Hill . . . 7,070 „	Camel's Back 7,143 „	„ Bazár . . 6,719 „
Green Mount . . 7,002 „	Mule Shed 6,562 „	„ Church . . 6,777 „
Laltipá 7,602 „	Milner's Cottage . . 6,641 „	Landáur Church . 7,369 „
Eagle's Nest . . 7,041 „	Newland's House . . 6,863 „	„ Bazár . . 6,808 „
Bellevue 7,125 „	Cocley Hall 6,506 „	„ Hospital
Waverley 7,057 „	Camville 6,288 „	(Chimney) 7,511 „
		Mallingárh 6,936 „
		Woodstock 6,877 „

No. 341. DÚDA, $31^{\circ} 11'$; $78^{\circ} 3'$, in Símla, on the right bank of the Rupín.

Loc. *Mean height of the village* 8,732 ft. Herb. and Hodgs.

No. 342. YÚSU PASS, $31^{\circ} 24'$; $78^{\circ} 3'$, in Gārhwál-Kānāur, between the Buránda and
Shátul pass. 15,877 ft. Ger . .

No. 343. BUGDÁR GHÁT, $30^{\circ} 30'$; $78^{\circ} 2'$, in Gärhvál, a pass leading from the Bádri to the Aglár valley 6,690 ft. Schl., Ad.

G, Adie. 1855, Oct. 18, 10^h A.M.

A. 23·572; 64 0; 56. Símla 23·257; 54·9; 65 = 6,682 ft. Mássúri 23·662; 68·0; 59 = 6,697 ft.

No. 344. MASSRÁSSA, $30^{\circ} 32'$; $78^{\circ} 2'$, in Gärhvál, about 15 miles N. of Mássúri. .

Loc. *Mean height of the village* 4,677 ft. Schl., Rob.

7, Thermo-barom. 1855, Oct. 20, 5^h P.M. A. 203°·55 Fahr.; 64·2; 63. Mássúri 23·564; 58·1; 17.

Loc. 2) *Level of the Aglár* 2,657 ft. Schl., Ad.

G, Adie. 1855, Oct. 18, 4^h P.M. A. 27·166; 72 0; 40. Símla 23·233; 62·6; 56. + 44 ft.

No. 345. JÁNGLIK, $31^{\circ} 19'$; $78^{\circ} 2'$, in Símla, near the right bank of the Pábar.

Loc. 1) *Mean height of the village* 9,257 ft. Ger.

„ 2) *Junction of the Sípan and Pábar, S. of Jánglik* . . . 8,354 „ Ger.

No. 346. SHÁTUL PEAK ($M' \frac{1}{2}$) $31^{\circ} 24' \cdot 6$; $78^{\circ} 1' \cdot 7 \frac{1}{2}$, in Gärhvál-Kánáur, E. of the Shátul pass 17,269 ft. G. T. S.

Herbert and Hodgson, who mark this peak “j”, obtain as its height 17,425 ft. Schl., Rob.

No. 347. DHOIVÁLA MOUNTAIN, $30^{\circ} 7' \cdot 1$; $78^{\circ} 1' \cdot 1 \frac{1}{2}$, in Gärhvál, 18 miles N.W. of Hårdvár.

Loc. *Top of the mountain* 3,064 ft. G. T. S.

„ *ditto* 3,034 „ I. A. 48.

No. 348. DÉRA, $30^{\circ} 18' \cdot 9$; $78^{\circ} 1' \cdot 0 \frac{1}{2}$, in Gärhvál, the principal place in the Déra Dün.

Loc. 1) *Large temple* 2,369 ft. Herb. and Hodgs.

„ *ditto* 2,349 „ Ger.

„ 2) *Satis tank, W. of Déra* 2,086 „ Herb. and Hodgs.

„ 3) *Dák bángalo* 2,240 „ Schl., Hark.

G, Adie. 1857, Dec. 3, 10 A.M. A. 27 752; 58 4; 62. Símla 23·296; 45·0; 60 = 2,247 ft.

„ „ „ 4, 10 „ „ 27·819; 59·4; 54 „ 23 328; 41·7; 67 = 2,232 „

No. 349. BAMANVÁLA, $30^{\circ} 17'$; $78^{\circ} 0'$, in Gärhvál, near Déra, in the Déra Dün.

Loc. *Temple* 2,220 ft. Herb. and Hodgs.

No. 350. LINGVĀR, $31^{\circ} 17'$; $78^{\circ} 0'$, in Símġa, near the right bank of the Pábar.

Loc. *Mean height of the village* 8,759 ft. Ger.

No. 351. BANÓG HILL, $30^{\circ} 28' \cdot 5$; $77^{\circ} 59' \cdot 9 \frac{1}{2}$, in Gārġvāl, near the sanitarium of Māssúri.

Loc. 1) *Cistern of General Sir A. Waugh's barometer* 7,549 ft. G. T. S.

„ 2) *Banóg Observatory* 7,450 „ G. T. S.

This value (exactly 7,449.73) has been deduced by levels, brought up from sea by the Calcutta Meridional and North East Longitudinal Series, and verified by operations extending to Bombay.

Sir A. Waugh in manuscript map.

No. 352. DÚDHILI MOUNTAIN, $30^{\circ} 28'$; $77^{\circ} 59'$, in Gārġvāl, W.S.W. of Māssúri.

Loc. *Top of the mountain* 7,254 ft. Herb. and Hodgs.

No. 353. KANDIGHÁT MOUNTAIN, $31^{\circ} 10'$; $77^{\circ} 59'$, in Gārġvāl, S. of the Chángsil mountain and N. of the Cháro mountain 12,942 ft. G. T. S.

No. 354. CHÁNGSIL, or CHÁISELE MOUNTAIN, $31^{\circ} 12' \cdot 9$; $77^{\circ} 58' \cdot 8 \frac{1}{2}$, in Símġa-Kāmáur, in the ridge between the Rupín and Pábar 12,871 ft. Herb. and Hodgs.

It is seen as one of the ridges of the middle ground in the western part of the Kidarkánta panorama; in the Jáko panorama also the eastern limits of the view would reach far enough to include this mountain; but it seems not elevated enough to be recognised. Schl., Ad.

No. 355. TUNBÁRA, $30^{\circ} 13'$; $77^{\circ} 58'$, in Gārġvāl, a village S.W. of Déra.

Loc. *Mean height of the village* 1,932 ft. Jacq.

No. 356. JĀTVAR, $31^{\circ} 15'$; $77^{\circ} 58'$, in Símġa, near the right bank of the Pábar.

Loc. *Mean height of the village* 8,177 ft. Ger.

No. 357. SHÁTUL, or PÁNUI PASS, $31^{\circ} 25'$; $77^{\circ} 58'$, in Gārġvāl-Kāmáur, W. of the Buránda pass 15,555 ft. Ger.

No. 358. BARIKÁNDĀ MOUNTAIN, $31^{\circ} 31'$; $77^{\circ} 58'$, in Símġa, about 8 miles S. of the Sátlej, E. of Séran 12,202 ft. G. T. S.

No. 359. MÍTA BÉRI, $30^{\circ} 19'$; $77^{\circ} 57'$, in Gärhvál, a few miles W. of Déra, in the Déra Dün.
 Loc. *Mean height of the village* 2,189 ft. Herb. and Hodgs.

No. 360. BHADRÁJ, $30^{\circ} 29'$; $77^{\circ} 57'$, in Gärhvál, a peak 10 miles W. of Banóg hill.
 Loc. *Top of the peak* 7,510 ft. Herb. and Hodgs.
 „ *ditto* 7,409 „ I. A. 48.

No. 361. CHÁURAS, $31^{\circ} 2'$; $77^{\circ} 57'$, in Símla, W. of the Tons.
 Loc. *Mean height of the village* 6,568 ft. Herb. and Hodgs.

No. 362. LAL DARVÁZA PASS, $30^{\circ} 14'$; $77^{\circ} 56'$, in Gärhvál, in the western parts of the Dün, S.W. of Déra.

Loc. *Top of the pass* 2,935 ft. Herb. and Hodgs.
 „ *ditto* 2,728 „ Ger.

No. 363. BÁIRAT MOUNTAIN, $30^{\circ} 35'$; $77^{\circ} 56'$, in Gärhvál, a peak 4 miles W. of the Jámna.

Loc. 1) *Fort on the top* 7,599 ft. Herb. and Hodgs.
 „ *ditto* 7,497 „ I. A. 48.
 „ 2) *Temple near Báirat* 7,806 ft. Herb. and Hodgs.

No. 364. LAMBATÁJ MOUNTAIN, $30^{\circ} 1'$; $77^{\circ} 55'$, in Gärhvál, N. of the Tons.

Loc. *Top of the mountain* 10,485 ft. G. T. S.

No. 365. KÁRSVA PEAK ($4\frac{1}{2}$), $31^{\circ} 25'4$; $77^{\circ} 54'8$, in Símla, in the range between the Sátlej and the Pábar 17,201 ft. G. T. S.

Herbert and Hodgson, who mark this peak “d”, give as its height 17,174 ft. It is one of the least distant snow peaks in the Jáko panorama. Schl., Herm.

No. 366. NANASPÁR, $31^{\circ} 33'$; $77^{\circ} 54'$, in Símla, 2 miles S. of the Sátlej.

Loc. *Hill Station* 7,662 ft. G. T. S.

No. 367. VÁNGTU BRIDGE, $31^{\circ} 37'$; $77^{\circ} 54'15$, in Símla, on the confluence of the Vángar and the Sátlej.

Loc. *Level of the bridge* 4,932 ft. Schl., Herm.
 „ *ditto* 5,250 „ Ger.
 „ *ditto* 5,289 „ J. A. Herbert.

1, Greiner. 1856, June 8, 6^h 15^m A.M. A. $24^{\circ} 937$; $57^{\circ} 9$; 91. Símla $23^{\circ} 139$; $64^{\circ} 4$; 90. — 21 ft.

No. 368. RÚNEPU PEAK (5 $\frac{1}{2}$), $31^{\circ} 26' \cdot 3$; $77^{\circ} 53' \cdot 7 \frac{1}{2}$, in Símla-Kānāur, on the range between the Sātlej and the Pábar 16,903 ft. G. T. S.

Herbert and Hodgson, who mark this peak "a", give as its height 17,044 ft.

No. 369. NĀCHĀR, $31^{\circ} 38'$; $77^{\circ} 53'$, in Símla, on the left bank of the Sātlej, near the Vángtu bridge.

Loc. <i>Mean height of the village</i>	5,250 ft.	Ger.
" <i>ditto</i>	5,289 "	J. A. Herbert.

No. 370. CHIRGÁŮ, $31^{\circ} 14'$; $77^{\circ} 52'$, in Símla, near the confluence of the Pábar and Andriti.

Loc. 1) <i>Level of the confluence</i>	5,607 ft.	Herb. and Hodgs.
" 2) <i>Undefined</i>	5,985 "	Ger.
" 3) <i>Tikrigáũ</i>	6,799 "	Ger.
" 4) <i>Sánga (bridge of spars) over the Adriti, above Chirgáũ</i>	6,080 "	Ger.

No. 371. TRÁNDA, OR TARÁNDA, $31^{\circ} 34'$; $77^{\circ} 49'$, in Símla, near the left bank of the Sáildang, an affluent of the Sātlej, W. of the Vángtu bridge.

Loc. 1) <i>Mean height of the village</i>	7,089 ft.	Ger.
" 2) <i>Level of the Sáildang at Tránda</i>	5,849 "	Ger.

No. 372. HĀRIPUR, $30^{\circ} 30'$; $77^{\circ} 48'$, in Gārhvāl, near the confluence of the Jánma and the Tons.

Loc. <i>Level of the confluence</i>	1,686 ft.	Herb. and Hodgs.
---	-----------	------------------

No. 373. SABHAVÁLA, $30^{\circ} 22'$; $77^{\circ} 47'$, in Gārhvāl, western part of the Dera Dūn, on the left bank of the Ásan nádi.

Loc. <i>Large tree</i>	1,792 ft.	Herb. and Hodgs.
----------------------------------	-----------	------------------

No. 374. SAHÍNSPUR, $30^{\circ} 23'$; $77^{\circ} 47'$, in Gārhvāl, on the right bank of the Ásan nádi, western part of the Dera Dūn.

Loc. <i>Mean height of the village</i>	1,754 ft.	Herb. and Hodgs.
" <i>ditto</i>	1,830 "	Ger.

No. 375. RONTÁN, $31^{\circ} 7'$; $77^{\circ} 47'$, in Símla, on the left bank of the Pábar, an affluent of the Tons.

Loc. <i>Mean height of the village</i>	7,898 ft.	Herb. and Hodgs.
--	-----------	------------------

No. 376. BAMBHÓRÁ GÁRH, $31^{\circ} 14'$; $77^{\circ} 47'$, in Símla, on a ridge between the Andriti and the Matrėti.

Loc. *Fort.* 9,844 ft. Herb. and Hodgs.

No. 377. SÉRAN, or SÁRHAN, $31^{\circ} 30' \cdot 7$; $77^{\circ} 46' \cdot 8 \frac{1}{2}$, in Símla, near the left bank of the Sátlej.

Loc. 1) *Staff near the Rájah's palace.* 7,115 ft. - G. T. S.

.. 2) *Mean height of the village* 6,906 „ Schl., Herm.

.. *ditto* 7,248 „ Ger.

.. *ditto* 7,246 „ J. A. Herbert.

1, Greiner. 1856, June 4, 8^h A.M. A. $23 \cdot 288$; $55 \cdot 4$; 48. Símla $23 \cdot 162$; $63 \cdot 0$; 55.

No. 378. RATÁNG PEAK (SIL. $\frac{1}{2}$), $32^{\circ} 1' \cdot 5$; $77^{\circ} 46' \cdot 4$, in Kúlu, E. of the hot springs at Manikáru, on the right bank of the Párbáti 21,365 ft. G. T. S.

Visible in the Jáko panorama. Schl., Herm.

Before concluding this area, we add the heights of Kānāur; the powerful crest to its south, and the circumstance of its principal connection with the southern Himálayan provinces being only effected by the narrow outlet of the Sātlej valley above Vángtu, induced us not to mix up its heights indiscriminately with those of the Himálaya in general. Some geographers even considered Kānāur topographically to form the southernmost part of Tibet; but it is as coherent with the Himálayan provinces by the ramifications of its mountain systems, as it is analogous by its hypsometrical features.

The following heights of Kānāur succeed each other from East to West.

No. 692. KIÓBRANG (KEOBRUNG) PASS, 31° 36'; 78° 56', in Kānāur, S. of the Sātlej.

APPENDIX TO AREA VIII.

Nos. 756-8. MALÁRI PEAKS, in Garhvál.

No. 756. MALÁRI EAST PEAK, $30^{\circ} 45'$; $79^{\circ} 32'$. . . 19,600 ft. Strach.

No. 757. MALÁRI CENTRAL PEAK, $30^{\circ} 46'$; $79^{\circ} 29'$. . . 20,500 ft. Strach.

No. 758. MALÁRI WEST PEAK, $30^{\circ} 46'$; $79^{\circ} 28'$. . . 21,200 ft. Strach.

They are distinctly visible as well defined peaks in the Bóko La panorama. Schl., Ad.

No. 759. SĀRSÚTTI PEAK, $30^{\circ} 49'$; $79^{\circ} 22'$, in Garhvál, S.E. of the Íbi Gámin peak.

Loc. *Top of the peak* 23,900 ft. Strach.

Visible as a broad peak in the Bóko La panorama. Schl., Ad.

Nos. 760-1. ÍBI GĀMIN PEAKS, in Garhvál-Ghári Khórsum.

No. 760. ÍBI GĀMIN EAST PEAK, $30^{\circ} 52'$; $79^{\circ} 22'$. . . 24,200 ft. Strach.

No. 761. ÍBI GĀMIN WEST PEAK, $30^{\circ} 54'$; $79^{\circ} 19'$. . . 24,000 ft. Strach.

These peaks are well visible in the Bóko La panorama. Schl., Ad.

PART IV.

HEIGHTS DETERMINED IN TÍBET,

AND SECTIONS ACROSS THE

CHAINS OF THE KARAKORÚM AND KUENLÚEN.

AREA IX., X., AND XI.

As the hypsometrical conditions of these three areas are generally analogous, and for two of them, at least, we are able to present but comparatively few data, a separate discussion of their characteristics would be altogether superfluous. The following remarks have reference, therefore, to the three divisions combined.

The territories comprised in these areas are the whole of Western Tibet, including the western parts of two of the three principal mountain ranges of High Asia, the Karakorúm, and Kuenlúen.

In reference to its hypsometrical features, this region may well be considered as one of the most interesting parts of our globe. There are peaks to be seen rivalling in height the lofty Kanchinjunga, which was considered till recently as the inferior only of Gaurisáňkar. Some of the valleys show an average elevation to be found nowhere else; and large plateaux—not met with at all in the Himálayan Proper—are of no rare occurrence even at altitudes where they are not usually found in any other part of the globe. Another characteristic feature, in which the Himálaya, with a few insignificant exceptions, is entirely wanting, consists in the numerous lakes of the region, some of them lying at elevations of 14,000 or 15,000 feet. One of the highest of these lakes, called the Tsomognalari, covers an area of more than 250 square miles.

From a comparison with the two preceding areas, in which Himálayan heights are given, it will appear, that, though the mean height of *peaks* in the Himálaya exceeds that of the peaks in the Karakorúm, yet the mean general elevation of the *crests* and *passes* is decidedly greater for the latter. To this conclusion we are already able to arrive, notwithstanding that our general knowledge of the hypsometrical conditions of the Karakorúm and Kuenlúen must be considered as yet very incomplete. The

difficulties in the way of more accurate information in these parts are at once political and natural. For, not only is the country jealously guarded against the intrusion of strangers, thus necessitating a recourse to the strictest disguise on the part of the traveller, but from the general great elevation of the land, the air is so rarefied and bleak, as to place both the bodily and mental powers of the observer under a considerable disadvantage.

In our subsequent discussions on the extreme limits of height in reference to habitations, snow-lines, vegetations, &c., it will be found that the great mass of our data are derived from these three areas alone. (See part V.)

For our heights in Turkistán we have no data whatever for comparison. However, the circumstances under which they were obtained may be considered particularly favourable, as we were fortunate enough, not only to make them at the fittest season of the year, but also to calculate them from corresponding stations exceedingly well situated for the purpose; the importance of hypsometrical materials for these regions in particular, having induced us to make such arrangements in the disposition of our establishment as were suitable to this end.

At the conclusion of this chapter we have ventured to give approximate values for the heights of Élechi, Yárkand, and Káshgar, though we may now indulge in the hope that more definite results will soon be arrived at by the well known scientific members of the mission to Central Asia, which is to start under the direction of Captain Smyth in the early part of the ensuing year.

AREA IX.

CENTRAL CHAIN OF WESTERN TÍBET.

No. 1. GÚRLA, or MANDHÁTA PEAK, $30^{\circ} 27'$; $81^{\circ} 15'$, in Gnári Khórsum, S. of the Mansaráuer lake. 25,200 ft. Strach.

Indistinctly visible in the Gunshankár panorama as the easternmost peak. Schl., Ad.

No. 2. TÍSE PEAK, $31^{\circ} 4'$; $81^{\circ} 11'$, in Gnári Khórsum, N. of the Mansaráuer lake.

Loc. *Top of the peak* 22,000 ft. Strach.

A steep, well defined peak in the Gunshankár panorama. Schl., Ad.

NO. 3. GUNSHANKÁR PEAK, $31^{\circ} 23' \cdot 5$; $80^{\circ} 18' \cdot 0$ P, in Gnári Khórsum, situated in the range between the Sátlej and Indus.

Loc. 1) *Top of the peak* 19,699 ft. Schl., Rob.

8, Thermo-barom. 1855, July 29, 3^h P.M.

A. $178^{\circ} \cdot 13$ Fahr.; $49 \cdot 6$; 17. Mássúri 23·417; $67 \cdot 6$; 93 = 19,693 ft. Símla 23·040; $67 \cdot 6$; 93 = 19,704 ft.

Loc. 2) *Snow limit on the western slopes of the Gunshankár peak*

18,665 ft. Schl., Rob.

8, Thermo-barom. 1855, July 29, 6^h P.M. A. $179^{\circ} \cdot 62$; $39 \cdot 0$; 40. Mássúri 23·454; $67 \cdot 1$; 91.

„ 3) *Snow limit on the northern slopes of the Gunshankár peak*

18,010 ft. Schl., Ad.

Trigonometrically measured.

„ 4) *Highest phanerogamic plants, on the western slopes of the Gunshankár peak*

19,237 „ Schl., Rob.

= 572 ft. above the limit of snow; by aneroid.

„ 5) *Upper limit of shrubs, on the western slopes of the Gunshankár peak*

17,313 „ Schl., Ad.

NO. 4. CHÁKO LA PASS, $31^{\circ} 23' \cdot 9$; $80^{\circ} 11' \cdot 0$ P, in Gnári Khórsum, on the ridge between the Indus and Sátlej.

Loc. 1) *Top of the pass* 17,561 ft. Schl., Rob.

8, Thermo-barom. 1855, July 30, 11^h A.M.

A. $181^{\circ} \cdot 68$ Fahr.; $51 \cdot 8$; 47. Mássúri 23·457; $66 \cdot 2$; 94 = 17,562 ft. Símla 23·052; $67 \cdot 8$; 94 = 17,560 ft.

In the Tóling Dóra panorama the direction of the pass is visible. Schl., Ad.

Loc. 2) *Usual encamping ground at the south-western foot of*

the pass 16,197 ft. Schl., Rob.

8, Thermo-barom. 1855, July 26, 9^h A.M. A. $183^{\circ} \cdot 79$ Fahr.; $46 \cdot 6$; 81. Símla 23·063; $64 \cdot 8$; 96

NO. 5. CHÍBLEN PEAK, $31^{\circ} 29'$; $80^{\circ} 10'$, in Gnári Khórsum, N.N.W. of the Cháko La pass 20,500 ft. Strach.

We have given to this peak, for which the height only is mentioned by Strachey, the name by which it is known to the Huníás. The peak is visible in the Tóling panorama as a prominent object. Schl., Ad

NO. 6. BÓKO LA PASS, $31^{\circ} 35'$; $80^{\circ} 2'$, in Gnári Khórsum, on the ridge between the Sátlej and Indus.

Loc. 1) *Southern foot of the pass* 16,687 ft. Schl., Rob.

6, Adie. 1855, Sept. 10, 10^h A.M.

A. $16 \cdot 382$; $45 \cdot 7$; 28. Mássúri 23·589; $65 \cdot 6$; 92 = 16,701 ft. Símla 23·193; $63 \cdot 1$; 90 = 16,673 ft.

Loc. 2) *Top of the pass*. ab. 18,450 ft. Schl., Ad.

Approximatively determined.

.. 3) *Plateau-like surface of the Sáltej valley above Δ Kióm* 15,184 ft. Schl., Ad.

6, Adie. 1855, Sept. 10, 2^h P.M.

A. 17 366; 58 6; 20. Símla 23 185; 65 5; 88 = 15,183 ft. Mássúri 23 569; 66 4; 91 = 15,185 ft.

From the Bóko La pass a panorama was drawn by Adolphe; see the Panoramic Profiles, plate No. IV. The direction of the pass is visible both in the Tóling Dóra and the Nélong panorama.

Schl., Ad.

No. 7. SÁSSER PASS, $35^{\circ} 6' 0''$; $77^{\circ} 27' 6''$, in Núbra, on the summer route from Ladák to Yárkand.

Loc. 1) *Top of the pass*. 17,753 ft. Schl., Rob.

.. *ditto* 17,500 „ Thoms.

5, Thermo-barom. 1856, Sept. 8, 10^h A.M. B = Leh; C = Símla; D = Mássúri. Loc. corr. = 3 ft.

A. 181° 13 Fahr.; 30 6; 42. B. 19 713; 66 0; 8 = 17,790 ft. C. 23 154; 65 1; 92 = 17,710 ft.

D. 23 599; 64 4; 96 = 17,760 ft.

Loc. 2) *Lateral ridge of the Sásser peak, E. of Sásser pass*. 19,189 ft. Schl., Herm.

1, Greiner. 1856, Aug. 3, 12^h 30^m P.M. B = Mássúri; C = Símla; D = Leh.

A. 14 981; 56 8; 16. B. 23 500; 64 4; 98 = 19,216 ft. C. 28 060; 63 9; 96 = 19,144 ft.

D. 19 662; 73 9; 38 = 19,207 ft.

Here we put up a theodolite, and erected a flag. (See plate No. VII. of the Atlas of Panoramas and Views.)

Loc. 3) *Highest point reached on the rocks above the flag* . . . 20,120 ft. Schl., Herm.

Measured by the theodolite. The point reached was not the extreme top of the peak which is visible on the plate as a gently inclined snow-pyramid.

Loc. 4) Δ Sásser, a halting place, surrounded by a stone wall,

on the northern foot of the Sásser pass 15,339 ft. Schl., Rob.

.. *ditto* 15,400 „ Thoms.

5, Thermo-barom. 1856, Aug. 4 and Sept. 8. B = Leh.

7^h 0^m P.M. A. 185° 33 Fahr.; 49 5; 40. B. 19 685; 72 3; 26 = 15,357 ft.

7^h 30^m A.M. „ 185° 29 „ ; 43 2; 21. „ 19 725; 55 9; 19 = 15,335 „ Símla 23 170; 62 1; 93 = 15,325 ft.

Here is also the upper limit of shrubs.

Loc. 5) Δ Pantángsa, a halting place on the southern side

of the Sásser pass 14,644 ft. Schl., Rob.

1, Greiner. 1856, Aug. 1, 4^h P.M. B = Mássúri; C = Símla.

A. 17 607; 66 9; 3. B. 23 438; 63 1; 90 = 14,660 ft. C. 28 024; 63 3; 95 = 14,628 ft.

Loc. 6) Δ Skiangbóche, above Δ Pantángsa, and lower end of

the Sásser glacier 15,659 ft. Schl., Rob.

= 1,015 ft. above Δ Pantángsa; by aneroid.

No. 8. LÁRIMO PEAK, $34^{\circ} 8' \cdot 4$; $77^{\circ} 15' \cdot 9$ E, in Ladák, 6,718 ft. N. $86^{\circ} 33' 46''$ E. of Leh, the capital of Ladák.

Loc. *Top of the peak* 13,293 ft. Schl., Rob.

Trigonometrically measured from Leh. A panorama was drawn from Lárímo by Hermann. See panoramic profiles, plate No. VI.

No. 9. LAÓCHE PASS, $34^{\circ} 14' \cdot 9$; $77^{\circ} 14' \cdot 4$ E, in Ladák-Núbra, leading from Leh to Núbra (Indus to the Shayók valley).

* Loc. 1) *Top of the pass* 17,911 ft. Schl., Rob.

„ *ditto* 17,600 „ Thoms.

5, Thermo-barom. 1856, Sept. 12, 4^h p.m. B = Leh; C = Simla; D = Massúri.

A. $181^{\circ} \cdot 04$ Fahr.; 41·2; 10. B. $19^{\circ} \cdot 705$; 61·2; 11 = 17,866 ft. C. $23^{\circ} \cdot 193$; 64·0, 91 = 17,919 ft.

D. $23^{\circ} \cdot 607$; 64·8; 90 = 17,948 ft.

Loc. 2) *Glacier lake on the northern slopes of the Laóche pass* 16,076 ft. Schl., Rob.

= 1,835 ft. below the top of the pass; by aneroid.

Here is also the upper limit of grass vegetation.

Loc. 3) *Snow limit on the northern slopes of the Laóche pass* 16,400 ft. Schl., Rob.

„ 4) *Snow limit on the southern slopes of the Laóche pass* 17,900 „ Schl., Rob.

The snow-limits have been determined by aneroid.

AREA X. PRINCIPAL SNOW-PEAKS OF THE WESTERN PARTS OF THE KARAKORÚM CHAIN.

No. 10. CHANGHÉNMO PASS, ab. $34^{\circ} 9'$; $79^{\circ} 25'$, in Pangkóng-Turkistán, N.E. of the salt lake Tsomognalari ab. 18,800 ft. Schl., Rob.

This pass, situated in the Karakorúm range (S.E. of the Karakorúm pass) was crossed by Adolphe, June 18, 1857, not as we formerly thought (see Vol. I., p. 33) July 9, 1857, on his last and fatal journey to Turkistán. From the description given of this pass by his attendants (see Vol. I. pp. 60 and 63) and from our general knowledge of the hypsometrical features in this region, we have estimated its height, which we hope will prove very near the truth.

No. 11. YURUNGKÁSH PASS, ab. $36^{\circ} 0'$; $79^{\circ} 58'$, in Turkistán, leading from the Karakásh valley one day's journey above \triangle Siándér Mokám across the Kuenlúen to Yurungkásh.

Loc. *Top of the pass* 16,620 ft. Schl., Herm.

Trigonometrically measured; the top was, however, not quite distinctly visible, and the value obtained is an approximation. The direction in which the pass lays, is distinctly visible in the Yurungkásh darvása panorama.

No. 12. KÁFIR PEAK, $35^{\circ} 52'$; $78^{\circ} 12'$ P, in Turkistán; N. of Káfir Déra.

Loc. *Top of the peak* 18,950 ft. Schl., Herm.

This peak is already 800 ft. above the snow limit, which attains on its flanks a height of 18,120 ft. Schl., Herm.

No. 13. ÉLCHI DAVÁN PASS, $36^{\circ} 13'$; $78^{\circ} 7'$ P, in Turkistán, Kuenlúen range, separating the Karakásh from the Élchi valley.

Loc. 1) *Top of the pass* 17,379 ft. Schl., Rob.

5, Thermo-barom. 1856, Aug. 23, 1^h P. M. *B* = Símla; *C* = Mássúri.

A. $181^{\circ} 56$ Fahr.; 25 5; 90. *B.* 23·127; 63·9; 97 = 17,370 ft. *C.* 23·544; 64 2; 93 = 17,388 ft.

Loc. 2) *Lower end of the Élchi pass glacier, on the northern*

slopes of the pass 14,810 ft. Schl., Herm.

= 2,569 ft. below the pass; by aneroid.

Here is also the upper limit of grass vegetation.

Loc. 3) *Above \triangle Oitásh, left side of the Élchi pass glacier,*

on its northern slopes 13,137 ft. Schl., Rob.

5, Thermo-barom. 1856, Aug. 28, 7^h A.M. A. 189° 10 Fahr.; 34° 3'; 89. Lch 19° 768; 55° 0'; 60.

Loc. 4) *\triangle Oitásh, a pasture ground with fine grass, below the*

northern Élchi pass glacier, in the Búshia valley. . . . 12,220 ft. Schl., Rob.

„ 5) *Upper limit of shrubs in the Búshia valley* 11,140 „ Schl., Rob.

Loc. 4 and 5 are referred by aneroid to locality 3. The upper limit of shrubs is remarkably low throughout the northern slopes of the Kuenlúen.

NOS. 14-15. SÚGET DAVÁN PEAKS, in Turkistán.

No. 14. SÚGET DAVÁN EAST PEAK, 36° 8' 4; 77° 54' 1 P . . 20,648 ft. Schl., Herm.

No. 15. SÚGET DAVÁN WEST PEAK, 36° 8' 1; 77° 50' 4 P . . 19,902 ft. Schl., Herm.

These two peaks are in the immediate vicinity of the Súget Daván pass, from which they also have been measured. The west peak is about 200 ft. above the snow line. Schl., Herm.

NOS. 16-17. KISSILKORÚM PEAKS, in Turkistán.

No. 16. KISSILKORÚM EAST PEAK, 35° 55'; 77° 52' P . . 18,555 ft. Schl., Herm.

No. 17. KISSILKORÚM WEST PEAK, 35° 55'; 77° 50' P . . 18,676 ft. Schl., Herm.

These two peaks were not measured from the Kissilkorúm itself, but 350 ft. lower down. Both peaks were free from snow in August, though just reaching the height of the snow-limit. The East peak, visible from the Aktágh panorama, is situated close to the left bank, the West peak close to the right bank of the Karakásh. Schl., Herm.

No. 18. AKSÁE CHIN, 35° 52'; 77° 51' P, in Turkistán, the name of a lake basin, now drained, but occasionally filled with water.

Loc. *Level of the lake basin* 16,620 ft. Schl., Herm.

= 1,142 ft. below the Kissilkorúm pass.

The general form and extent of this lake basin is seen in the Aktágh panorama. Schl., Herm.

NO. 19. KISSILKORÚM PASS, $35^{\circ} 57'$; $77^{\circ} 50'$ $\overline{\text{P}}$, in Turkistán, in the ridge between the Yárkand and Karakásh.

Loc. 1) *Top of the pass*. 17,762 ft. Schl., Rob.

5, Thermo-barom. 1856, Aug. 11, 5^h 30^m P.M. *B* = Leh; *C* = Símla; *D* = Mássúri.

A. 181° 30 Fahr.; 53° 2; 0. *B.* 19° 575; 76° 1; 8 = 17,705 ft. *C.* 23° 095; 64° 6; 98 = 17,800 ft.

D. 23° 451; 65° 1; 94 = 17,781 ft.

The pass is visible from the Aktágh panorama. Schl., Herm.

Loc. 2) Δ *Camp on its northern slopes* (Aug. 11—12). 17,390 ft. Schl., Rob.

5, Thermo-barom. 1856, Aug. 12, 9^h A.M. *B* = Símla; *C* = Mássúri.

A. 182° 00 Fahr.; 55° 0; 0. *B.* 23° 111; 63° 5; 98 = 17,399 ft. *C.* 23° 473; 64° 8; 96 = 17,380 ft.

Not a trace of vegetation was to be found here.

NO. 20. KARAKORÚM PASS, $35^{\circ} 46' 9$; $77^{\circ} 30' 4$ $\overline{\text{P}}$, in Núbra-Turkistán, leading from Ladák to Turkistán.

Loc. 1) *Top of the pass*. 18,345 ft. Schl., Rob.

„ *ditto* 18,200 „ Thoms.

5, Thermo-barom. 1856, Aug. 9, and Sept. 4. *B* = Leh; *C* = Símla; *D* = Mássúri.

5^h P.M. *A.* 180° 32 Fahr.; 57° 2; 0. *B.* 19° 524; 81° 1; 20 = 18,317 ft. *C.* 23° 028; 63° 0; 97 = 18,356 ft.

10^h A.M. „ 180° 12 „ ; 49° 1, 7. „ 19° 713; 59° 2; 60 = 18,320 „ „ 23° 150; 64° 0; 95 = 18,355 „

D. 23° 535; 66° 0; 93 = 18,375 ft.

The depression formed by the pass is distinctly visible in the Aktágh panorama. Schl., Herm.

Loc. 2) Δ *Dáulut Bey Úlde, on the southern foot of the Kara-*

korúm pass 16,597 ft. Schl., Rob.

5, Thermo-barom. 1856, Aug. 9, 8^h A.M. *A.* 183° 12 Fahr.; 45° 0; 31. *Leh* 19° 654; 66° 4; 39.

Loc. 3) *Northern border of the Dápsang plateau* 17,706 ft. Schl., Rob.

5, Thermo-barom. 1856, Sept. 4, 5^h P.M. *B* = Leh; *C* = Símla; *D* = Mássúri.

A. 181° 35 Fahr.; 44° 6; 29. *B.* 19° 705; 59° 4; 58 = 17,714 ft. *C.* 23° 119; 62° 4; 99 = 17,683 ft.

D. 23° 528; 64° 0; 96 = 17,721 ft.

Loc. 4) *Mean height of the Dápsang plateau*. 17,500 ft. Schl., Rob.

The Dápsang plateau is still below the snow-limit. A few mountains in it rise 400 to 600 ft. higher; they are also quite free from snow.

NO. 21. SÚGET DAVÁN PASS, $36^{\circ} 6'$; $77^{\circ} 30'$, in Turkistán, in the high plateaux on the route from Ladák to Yárkand.

Loc. *Top of the pass* 17,683 ft. Schl., Rob.

5, Thermo-barom. 1856, Sept. 2, 10^h A.M. *A.* 181° 18 Fahr.; 35° 1; 58. *Leh* 19° 677; 54° 5; 62.

No. 22. DÁPSANG PEAK, $35^{\circ} 28'$; $77^{\circ} 10'$, in Núbra, W.S.W. of the Karakorúm pass, in the Karakorúm range 28,278 ft. G. T. S.

This peak, called by the G. T. S. "K2", is exceeded in height only by the Gaurisáňkar (29,002). Kanchinjंगा West peak is 122 ft. lower than the Dápsang peak.

The Dápsang peak was first seen by Dr. Thomson, who says in his "Western Himálaya", p. 429: "A grand snowy range was seen in perfection . . . I felt at the time fully convinced, that a very high peak was at least 24,000 ft. above the level of the sea."

We had occasion twice to pass this peak during our journeys to Turkistán. From the spot where Hermann drew a panorama (see the Dápsang panoramic profile, in which it forms the prominent object), we also tried to measure it, on our way home, but we could not obtain sufficient accuracy, being repeatedly interrupted by passing fogs.

Our inquiries for finding a native name for this peak proving to be useless, we call it "Dápsang peak", it forming so prominent an object of this elevated plateau, the highest probably of our globe.

The Dápsang peak was not visible from any of the routes travelled in Báľti and on the borders of Western Ladák by our brother Adolphe.

NOS. 23-4. MASHERIBRÚM PEAKS, in Báľti.

N.N.E. of Húshe, in the Karakorúm chain.

No. 23. MASHERIBRÚM WEST PEAK, $35^{\circ} 15' \cdot 3$; $76^{\circ} 36' \cdot 4$ P . . 25,626 ft. Schl., Ad.

This is the highest peak hitherto measured in Báľti; it is N.W. of the Dápsang peak (the peak K2 of the G. T. S.)

The Masheribrúm peak is seen from Húshe under an angle of $11^{\circ} 50'$. Schl., Ad.

No. 24. MASHERIBRÚM EAST PEAK, $35^{\circ} 42' \cdot 9$; $76^{\circ} 36' \cdot 9$ P . . 21,513 ft. Schl., Ad.

The Masheribrúm peaks are seen as distant but well marked objects in the Kánji panorama.
Schl., Ad.

No. 25. MUSTÁGH PASS, $36^{\circ} 1'$, $76^{\circ} 2'$, in Báľti-Turkistán, one of the highest passes of the Karakorúm, leading from Báľti to Turkistán.

Loc. 1) *Top of the pass*. 19,019 ft. Schl., Ad.

G, Adie. 1856, Aug. 22, B = Leh; C = Simla; D = Massurn.

11^h 45^m A.M. A. 14.989; 38.3; 38. B. 19.720; 61.0; 59 = 19,031 ft. C. 23.193; 61.6; 93 = 19,055 ft.

D. 23.591; 64.2; 93 = 19,050 ft.

12^h 40^m P.M. A. 15.004; 36.5; 52. B. 19.716; 62.2; 55 = 18,995 ft. C. 23.189; 61.6; 95 = 19,004 ft.

D. 23.575; 63.5; 94 = 18,976 ft.

Loc. 2) *Camp at the "mer de glace" of the Mustágh pass*. . 17,990 ft. Schl., Ad.

G, Adie. 1856, Aug. 22, 9^h A.M. B = Leh; C = Simla; D = Massurn.

A. 15.559; 33.4; 66 B. 19.750; 59.4; 66 = 18,008 ft. C. 23.201; 63.1; 94 = 17,967 ft.

D. 23.607; 61.6; 93 = 17,994 ft.

NO. 26. DIÁMER PEAK, or NÁNGA PÁRBÁT, $35^{\circ} 14' \cdot 4$; $74^{\circ} 34' \cdot 5 \frac{1}{2}$, in Hasóra.

Loc. *Top of the peak* 26,629 ft. G. T. S.

This peak, the highest in Hasóra, is situated close to the remarkable bend made by the Indus. It was measured from eleven principal stations by Captain G. T. Montgomerie, who gave of his operations minute details in the *Journal of the Asiatic Society of Bengál*, 1857, p. 266.

Adolphe, during his travels in Bálti, had repeatedly occasion to see and measure this splendid mountain, which, besides from many other places, is distinctly visible from the Nunevára mountain. (See the panoramic profiles, plate No. V.)

The following points, in the environs of the Diámer, were measured by Adolphe:

NO. 27. Δ CHU BIÁR, on the left side of the Táshing glacier.

Loc. *Level of the glacier* 10,789 ft. Schl., Ad.

G, Adie. 1856, Sept. 17, 7^h A.M. A. 20·221; 45·7; 70. Símla 23 162; 57·2; 93.

There are, just at this locality, a considerable quantity of fir-trees.

NO. 28. Δ RÚPAL, on the right side of the Táshing glacier, above the Rúpal lake.

Loc. *Encampment*. 10,010 ft. Schl., Ad.

G, Adie. 1856, Sept. 17, 12^h 40^m P.M. A. 20 891; 63·7; 60. Símla 23 189; 64·9; 92.

NO. 29. TÁMI CHÚET GLACIER. *Lower end* 10,460 ft. Schl., Ad.

Referred by aneroid to Δ Chu Biár.

NO. 30. Δ TAP. *Foot of the Tap glacier* 11,508 ft. Schl., Ad.

G, Adie. 1856, Sept. 18, 7^h A.M. A. 19 760; 43 2; 70. Símla 23 241; 58 1; 94.

Fir-trees are still growing here, already intermixed with shrubs.

NO. 31. MASÉNNO GLACIER. *Left moraine of the glacier* 13,176 ft. Schl., Ad.

G, Adie. 1856, Sept. 19, 6^h A.M. A. 18 532; 29 5; 60. Símla 23 241; 58 8; 97.

The upper limit of shrubs is at a height of 13,900 ft. Schl., Ad.

NO. 32. MASÉNNO GLACIER. *Lower end* 12,032 ft. Schl., Ad.

G, Adie. 1856, Sept. 19, 9^h A.M. B = Símla; C = Mássúri.

A. 19 115; 55·9; 60. B. 23 224; 61·9; 97 = 12,026. C. 23 634; 59·7; 94 = 12,038.

The *extreme* limit of fir-trees is here.

No. 33. TÁSHING GLACIER, an old lateral moraine, on the left side of the glacier, on the road from Táshing to Δ Rúpá 10,028 ft. Schl., Ad.

6, Adie. 1856, Sept. 20, 8^h 45^m A.M. Δ . 20° 9' 10"; 55° 6'; 60. Símla 23° 25'; 60° 4'; 97.

Nos. 34-7. KHÁGAN PEAKS, in Hasóra,

in the range between the Kishengánga and the Indus.

No. 34. KHÁGAN PEAK No. 19 $\frac{1}{2}$, 35° 7' 9"; 74° 25' 3 . . . 20,740 ft. G. T. S.

No. 35. KHÁGAN PEAK No. 16 $\frac{1}{2}$, 34° 56' 1"; 74° 18' 3 . . . 17,015 ft. G. T. S.

No. 36. KHÁGAN PEAK No. 26 $\frac{1}{2}$, 35° 0' 8"; 74° 10' 0 . . . 16,228 ft. G. T. S.

No. 37. KHÁGAN PEAK No. 21 $\frac{1}{2}$, 34° 48' 7"; 74° 2' 5 . . . 14,875 ft. G. T. S.

No. 38. PIR KE DHÉRI PEAK (No. 23 $\frac{1}{2}$), 34° 43' 5"; 73° 42' 6, in Hasóra, Khágan range, situated between the Kishengánga and Indus 16,487 ft. G. T. S.

This peak is in the Tibetan part of the Nunevára panorama one of the principal prominences in a range parallel to the Kishengánga, covered with numerous secondary glaciers. Schl., Ad.

No. 39. NÍLA PEAK (No. 25 $\frac{1}{2}$), 34° 35' 9"; 73° 38' 3, in Hasóra, Khágan range, between the Kishengánga and Indus 15,535 ft. G. T. S.

This peak belongs to the range which forms the watershed between the Indus and Kishengánga, and it is the westernmost object visible in the Tibetan part of the Nunevára panorama.

Schl., Ad.

No. 107. JÁONGLUNG NORTH PEAK, $32^{\circ} 58'$; $79^{\circ} 0'$. . 20,357 ft. Cunning.No. 108. JÁONGLUNG SOUTH PEAK, $32^{\circ} 57'$; $79^{\circ} 1'$. . 18,754 ft. Cunning.No. 109. HÁNLE, $32^{\circ} 48'$; $78^{\circ} 56'$, in Ladák, a monastery S. of the Indus.Loc. *Monastery*. 15,117 ft. Cunning.

Cunningham gives in his "Ladák", 1854, a view of this monastery (plate 20, p. 313), which is

certainly the highest permanently inhabited place, if the height he quotes p. 465 (15,117 ft.), and on his map, is to be depended upon. Thomson says in "Western Himálaya", 1852, p. 152: "Hánle, a Buddhist monastery inhabited by about twenty lamas, is built on the summit of a steep hill, which rises abruptly out of the plain."

None of us passed through Hánle during our journeys in Ladák.

No. 110. RÓNGO PEAK, $33^{\circ} 8'$; $78^{\circ} 54'$, in Ladák, N. of Hánle.

Loc. *Top of the peak* 20,786 ft. Cunning.

No. 111. HÁNLE TSO LAKE, $32^{\circ} 48'$; $78^{\circ} 54'$, in Ladák, W. of the monastery of Hánle 14,600 ft. Cunning.

According to Colonel Cunningham, this lake is the largest sheet of fresh water that exists in Ladák. See his "Ladák", p. 142.

No. 112. \triangle MANGKÁNG, $32^{\circ} 58'$; $78^{\circ} 53'$, in Ladák, S. of the Indus, N.N.W. of Hánle.

Loc. *Encamping ground* 15,020 ft. Cunning.

No. 113. TSO MITBÁL SALT LAKE, $33^{\circ} 25'$; $78^{\circ} 40'$, in Pangkóng, S. of the salt lake Tsomognalarí 14,167 ft. Schl., Herm.

1, Greiner. 1856, June 26, 1^h 30^m P.M.

A. 17 957; 61.0; 12. Simla 23.079; 70.0; 78 = 14,163 ft. Mässuri 23 481; 68.2; 86 = 14,171 ft.

See plate No. 4 of the Atlas of Panoramas and Views.

No. 114. TSO RUL SALT LAKE, $33^{\circ} 33'$; $78^{\circ} 44'$, in Pangkóng (referred to Pángur), S. of the salt lake Tsomognalarí 14,400 ft. Cunning.

No. 115. TSOMOGNALARÍ SALT LAKE, $33^{\circ} 39' 8''$; $78^{\circ} 38' 5''$, in Pangkóng, near \triangle Tákung 14,010 ft. Schl., Herm.

1, Greiner. 1856; June 29, 10^h 40^m A.M. A. 18.040; 59.7; 36. Simla 23.075; 72.9; 74. Loc. corr. — 33 ft.

Strachey gives as height for this lake 14,300 ft.

The Tsomognalarí lake is divided into two parts by a river delta, analogous to the lakes of Brienz and Thun in Switzerland. The two are about equal in surface; but according to native information, they differ in height, at about 40 ft.; the upper lake, which contains nearly fresh water, almost drinkable, being therefore 14,050 ft.

A panorama was drawn from \triangle Tákung by Hermann; see panoramic profiles, plate No. VI.

No. 116. LÁNAG PASS, $32^{\circ} 47'$; $78^{\circ} 38'$, in Ladák-Spíti, W. of Hánle.

Loc. 1) *Top of the pass* 18,746 ft. Cunning.

„ 2) *Gurkhyám, E. of the Lánag pass* 16,437 „ Cunning.

No. 117. PANOMÍG, or PANAMÍK, $33^{\circ} 48'$; $78^{\circ} 37'$, in Pangkóng, near the western border of the salt lake Tsomognalari.

Loc. *Mean height of the village* 14,146 ft. Schl., Herm.

1, Greiner. 1856, July 2, 9^h A.M.

A. 17 882; 50.0; 6. Símla 23.087; 68.9; 76 = 14,190 ft. Mässúri 23 417; 66.4; 90 = 14,102 ft.

No. 118. CHÚSHUL, or CHÚSEL, $33^{\circ} 31'$; $78^{\circ} 36'$, in Pangkóng, a small village about 8 miles S. of the salt lake Tsomognalari.

Loc. *Lower houses* 14,406 ft. Schl., Herm.

1, Greiner. 1856, June 28, 9^h 30^m A.M. A. 17.752; 46.2; 25. Símla 23 131; 67.5; 77.

It is one of the highest villages of Western Tibet.

No. 119. TSO GAM SALT LAKE, $33^{\circ} 10'$; $78^{\circ} 34'$, in Ladák, N. of the Tsomoríri salt lake 14,580 ft. Schl., Herm.

1, Greiner. 1856, June 25, 4^h P.M.

= 19 ft. above Hallabágh; by aneroid.

Cunningham gives for Márchalang 11,522 ft.

No. 139. ÚPSHI, $33^{\circ} 42'$; $77^{\circ} 21'$, in Ladák, on the left bank of the Indus.

Loc. 1) *Level of the Indus* 11,249 ft. Schl., Rob.

8, Pistor. 1856, June 27, 6^h 30^m P.M. A. 19·906; 58·6; 26. Mássúri 23 489; 66·9; 81.

„ 2) *Undefined* 11,654 ft. Cuning.

No. 140. GULABGÁRH, $34^{\circ} 5'$; $77^{\circ} 20'$, in Ladák, in the Indus valley, S.S.E. of Leh.

Loc. *Large garden*. 10,589 ft. Schl., Rob.

8, Pistor. 1856, June 29, 6^h A.M. A. 20·367; 53·6; 45. Simla 23 119; 62·1; 84.

No. 141. MÍRU, $33^{\circ} 34'$; $77^{\circ} 19'$, in Ladák, on an affluent of the Indus, between Gyá and Úpshi.

Loc. 1) *Mean height of the village* 12,248 ft. Schl., Rob.

8, Pistor. 1856, June 27, 10^h A.M.

A. 19 169; 44·6; 20. Simla 23 123; 64·3; 82 = 12,237 ft. Mássúri 23 528; 66·0; 84 = 12,258 ft.

Loc. 2) *Lower limit of "Táma" (Caragana versicolor) between*

Míru and Gyá 12,950 ft. Schl., Rob.

No. 142. DOLTAKHÚNG PEAK, $33^{\circ} 51'·4$; $77^{\circ} 17'·9$ P, in Ladák, on the left bank of the Indus, above Leh 19,356 ft. Schl., Herm.

Measured from Leh and the Lárímo peak.

The snow-limit on the northern slopes of this peak is at 18,300 ft.

A well marked snow-peak in the Lárímo panorama. Schl., Herm.

No. 143. NYMALÍNG PEAK, $33^{\circ} 49'·7$; $77^{\circ} 16'·9$ P, in Ladák, on the left bank of the Indus, S. of Leh 20,010 ft. Schl., Rob.

Measured from Leh and the Lárímo peak.

No. 144. HÍMIS, $33^{\circ} 59'$; $77^{\circ} 16'$, in Ladák, a large monastery, S. of Leh.

Loc. *Entrance to the temple* 12,324 ft. Schl., Herm.

5, Thermo-barom. 1856, Sept. 28, 9^h A.M. A. 190° 55 Fahr.; 49·3; 2. Leh 19·788; 50·0; 10.

For a view of this large monastery, see plate No. 16 of the Atlas of Panoramas and Views.

No. 145. LEH, $34^{\circ} 8'·3$; $77^{\circ} 14'·6$ P, in Ladák, the capital of this province, 3 miles N. of the Indus.

Loc. 1) *Cistern of the barometer* 11,532 ft. Schl., Herm. and Rob.

The detail of the observations upon which this result is based is given pp. 58 and 59, to which we add, that the house of the Gyálpo, seven stories high (see plate No. 9 of the Atlas of Panoramas and Views), is 145 ft. high.

The height of Leh, as given by previous observers, is: 11,712 ft. Cuning, 11,213 Mac., 11,800 Thoms.

Loc. 2) *Plain at the prayer wall, at the lower end of the town* 11,527 ft. Schl., Herm. and Rob.

Directly measured.

Loc. 3) *Entrance to a monastery, on the top of a hill, N.E.*

of Leh 12,147 „ Schl., Rob.

Trigonometrically measured from the Lárímo peak.

Loc. 4) *Level of the Indus at Leh* 10,723 „ Schl., Rob.

= 809 ft. below the barometer at Leh; trigonometrically measured.

„ 5) *Fine Cirrhi, measured from the Lárímo peak* 26,843 ft. Schl., Herm.

„ 6) \triangle *Kúrumpílu, on the southern foot of the Laóche pass* 15,470 „ Schl., Herm.

1, Greiner. 1856, July 21, 4^h P.M. A. 17·016; 48·6, 57. Leh 19·611; 63·7; 52.

No. 146. MÍRU PEAK, $33^{\circ} 47' \cdot 2$; $77^{\circ} 14' \cdot 3$ P, in Ladák, W. of Míru and on the left bank of the Indus 20,080 ft. Schl., Rob.

Measured from Leh and the Lárímo peak. It forms a prominent object in the Lárímo panorama. Schl., Herm.

No. 147. GYÁ, $33^{\circ} 29'$; $77^{\circ} 18'$, in Ladák, on an affluent of the Indus.

Loc. *Large Buddhist temple* 13,548 ft. Schl., Rob.

„ *ditto* 13,587 „ Cunnung

8, Pistor. 1856, June 27, 7^h A.M. A. 18·257; 46·8; 42. Simla 23·095; 60·6; 92.

At Gyá, one of the highest permanently inhabited villages, is also the upper limit of cultivation of grain.

No. 148. TÖK PEAK, $33^{\circ} 56' \cdot 4$; $77^{\circ} 4' \cdot 9$ P, in Ladák, on the left bank of the Indus, S.S.W. of Leh 21,034 ft. Schl., Rob.

Measured from Lárímo peak; the detail of the observations and calculations is given pp. 69 and 70. Cunningham gives in round numbers 21,000 ft.

The Tök peak presents itself beautifully from Leh; it also is distinctly visible from Lárímo.

Schl., Herm.

No. 149. KÁRKYAG, $33^{\circ} 4'$; $77^{\circ} 3'$, in Zánkhar, on the right side of the Shung valley, near the Tséri Tsenn.

Loc. *Level of the Shung* 13,613 ft. Schl., Ad.

6, Adie. 1856, June 20, 3^h P.M. B = Símla; C = Mássúri.

A. 18·288; 61·9; 24. B. 23·106; 72·7; 54. — 66 = 13,634 ft. C. 23·469; 70·2; 78. 70 = 13,591 ft.

Kárkyag is the highest village on the northern slopes of the Shínku La pass. At this village is the upper limit of cultivation in the Shung valley.

No. 150. \triangle DÁNSE, $33^{\circ} 6'$; $77^{\circ} 3'$, in Zánkhar, on the right bank of the Shung, below Kárgyag.

Loc. *Level of the Shung* 13,083 ft. Schl., Ad.

No. 164. LÁMA YÚRU, $34^{\circ} 11'$; $76^{\circ} 34'$, in Ladák, S.W. of Káltse and the Indus.

Loc. 1) *Large fields at the base of the village*. 11,480 ft. Schl., Rob.

8, Pistor. 1856, Oct. 6, 5^h 30^m P.M. *B* = Símla; *C* = Mässúri; *D* = Srinágger.
A. 19·772; 51·6; 10. *B.* 23·209; 62·4; 72 = 11,507 ft. *C.* 23·579; 61·9; 87 = 11,478 ft.
D. 24·796; 67·1; 33 = 11,455 ft.

„ 2) *Entrance to the large monastery*. 11,673 ft. Schl., Herm.
 = 193 ft. above the field at the village; by aneroid.

No. 165. PHÓTO LA PASS, $34^{\circ} 11'$; $76^{\circ} 31'$, in Ladák, W. of Láma Yúru, between this place and Henaskút.

Loc. *Top of the pass*. 13,555 ft. Schl., Rob.

„ *ditto*. 13,240 „ Cunning.

8, Pistor. 1856, Oct. 7, 10^h A.M.
A. 18·363; 43·9; 6. Símla 23·245; 65·1; 68 = 13,566 ft. Mässúri 23·622; 65·1; 90 = 13,544 ft.

No. 166. Δ BOK, $33^{\circ} 51'$; $76^{\circ} 29'$, in Zánkhar, at the southern foot of the Péntse La, a pass leading from Zánkhar to Dras.

Loc. 1) *Level of the river*. 13,287 ft. Schl., Ad.

6, Adie. 1856, June 29, 7^h A.M. *A.* 18·500; 47·1; 43. Símla 23·119; 62·8; 83. + 61 ft.

No trees grow here, but a great quantity of shrubs.

Loc. 2) *Lower end of the Búson glacier*. 13,382 ft. Schl., Ad.

= 95 ft. above the level of the river; by aneroid.

No. 167. HÁNU YÓGMA, $34^{\circ} 30'$; $76^{\circ} 32'$, in Ladák, E. of Da, on an affluent of the Indus.

Loc. 1) *Level of the river*. 10,418 ft. Schl., Ad.

6, Adie. 1856, July 7, 2^h P.M. *B* = Símla; *C* = Mässúri.
A. 20·477; 70·3; 4. *B.* 23·079; 67·8; 92. — 33 = 10,435 ft. *C.* 23·438; 67·3; 91. — 38 = 10,401 ft.

Loc. 2) *Upper limit of shrubs on the northern slopes* 13,400 ft. Schl., Ad.
= 2,982 ft. above Hānu Yógma; by aneroid.

The upper limit of shrubs is here remarkably low.

No. 168. KÁRBUR, $34^{\circ} 15'$; $76^{\circ} 27'$, in Dras, in the Kánji valley, S. of Da.

Loc. 1) *Mean height of the valley* 11,617 ft. Schl., Ad.

6, Adie. 1856, July 3, 12^h Noon.

A. 19·615; 67·1; 6. Símla 23·079; 66·4; 91 = 11,622 ft. Māssúri 23·457; 66·7; 97 = 11,616 ft. Loc. corr. — 32 ft.

8, Pistor. 1856, Oct. 7, 3^h P.M.

A. 19·733; 61·5; 6. Símla 23·217; 64·0; 63 = 11,624 ft. Māssúri 23·599; 61·5; 93 = 11,605 ft.

At Kárbu there are a great many trees, especially willows and poplars.

Loc. 2) *Námiga pass, between Kárbu and Vāka* 12,646 ft. Schl., Rob.

„ *ditto* 13,000 „ Cunning.

8, Pistor. 1856, Oct. 7, 5^h 30^m P.M.

A. 18·926; 42·4; 0. Símla 23·217; 60·8; 67 = 12,662 ft. Māssúri 23·591; 59·5; 93 = 12,629 ft.

No. 169. UMÁSI PASS, $33^{\circ} 21'$; $76^{\circ} 26'$, in Zānkhar-Kishtvár, in the Brima range, S.W. of Pádum 18,123 ft. Thoms.

No. 170. MALISHÓN, $34^{\circ} 23'$; $76^{\circ} 26'$, in Ladák, S. of Da.

Loc. *Mean height of the village* 10,753 ft. Schl., Ad.

6, Adie. 1856, July 3, 6^h P.M. A. 20 221; 61·7. Kárbu 19·607; 64·0.

No. 171. TÍMTI LA PASS, $34^{\circ} 12'$; $76^{\circ} 25'$, in Ladák, on the left side of the Kánji valley.

Loc. 1) *Top of the pass* 15,548 ft. Schl., Ad.

6, Adie. 1856, July 2, 5^h P.M. A. 16·941; 46·2; 40. Māssúri 23·378; 67·3; 95.

In conclusion, we venture—though no direct observations, for the moment, are at our disposal—to give hypsometrical values for Élchi, Yárkand, and Káshgar, the three principal towns in Turkistán. Major A. Cunningham, who has collected much varied information for the purpose,¹ remains, we believe, the only traveller who has computed the height of these places.

He adopts for Élchi 3,500 ft., Yárkand 4,000 ft., and Káshgar 4,500 ft.

Our own estimates, however, are somewhat different: for reasons hereafter stated, we adopt:²

No. 264. ÉLCHI, $36^{\circ} 50'$; $78^{\circ} 20'$ 5,500 ft.

No. 265. YÁRKAND, $38^{\circ} 10'$; $74^{\circ} 0'$ 4,200 ft.

No. 266. KÁSHGAR, $39^{\circ} 15'$; $71^{\circ} 50'$ 3,500 ft.

A comparison with Cunningham's values shows, that we differ by 2,000 ft. for Élchi, 200 ft. for Yárkand, and 1,000 for Káshgar.

Though not actually penetrating as far as the town of Élchi ourselves, yet we (Hermann and Robert) were sufficiently near it, to be able to place some reliance upon the information, that Élchi is just "at the foot of the mountains", and, therefore, in all probability the highest of the three towns. Our informants, moreover, were unanimous in one respect more especially, viz., that the amount of snow-fall at Élchi is considerably greater than that either of Káshgar or Yárkand, and that the snow remains upon the ground from 10 to 14 days before it finally disappears. It is true, that the proportionately greater snow-fall for Élchi may to a certain extent be accounted for by the closer proximity of the place to the mountains; yet the simple fact of its remaining so long upon the ground would nevertheless appear proof conclusive of considerable elevation. Élchi was also uniformly represented to have the coldest, as Káshgar the hottest temperature of the three towns throughout the year. Snow, indeed, is said to fall at Káshgar, but never to remain longer than a few hours; at the same time, there were many persons concurring in the statement, that they remembered to have seen snow lying in Yárkand for three or four days together. From all these reasons we assign to Káshgar a height of no more than 3,500 ft.

The vegetable products grown in each of these towns, about which we made careful and frequent inquiries, did not, as we had at first expected, furnish us with

¹ See "Ladák", 1854, p. 27.

² A discussion on the latitude and longitude of these places is contained in Vol. I., p. 269.

any additional basis for forming a correct idea upon the height of these places. In the first instance, it must be taken into consideration, that the difference of relative height between the three towns amounts only to 2,000 ft., and that the highest is the southernmost. Besides each of them containing a numerous population, it is not unreasonable to suppose, that many amongst them are able successfully to cultivate fruits and grains in their gardens, which, without artificial care and attention, would not have any existence at all in such heights. In order to arrive at a correct idea upon the subject, it would be necessary to ascertain the relative amount grown of the fruits, or vegetables, which we know to be restricted between certain heights. To elucidate this, however, was a matter of utter impossibility from the fact of our informants being merchants, and not agriculturists proper.

Two statements contained in Cunningham's "Ladák," appear to be contradicted by the representations made to us. *Rice* and *cotton*, we were informed, grow most abundantly in Káshgar, as well as *gram*, or *pulse* (*Cicer arietinum*).

OUR BROTHER ADOLPHE.
-

I. GENERAL HYPSONOMETRICAL TABLEAU OF INDIA AND HIGH ASIA.

A. THE DIFFERENT VARIETIES OF HABITATION: 1. Towns, villages, and pasture grounds. 2. Extreme heights visited by man, and effect of height. — *B.* GEOGRAPHICAL CONFIGURATIONS: 1. Plateaux and lakes. 2. Passes. 3. Peaks. — *C.* PHYSICAL PHENOMENA: 1. Snow-fall, snow-line, and glaciers. 2. Limits of vegetation and animal life.

The materials included in this volume may be considered ample enough to furnish a rough outline of the physical features of these regions in connection with their hypsometry. To render this picture complete, we found it necessary to add mean values for the snow-line, and for some of the limits of vegetation and animal life. We did so, however, with hesitation, knowing that we must postpone the full detail upon which the values are based to the subsequent volumes having special reference to such researches.

The various objects measured have been divided into three principal groups:

A. THE DIFFERENT VARIETIES OF HABITATION:

1. Towns, villages, and pasture grounds.
2. Extreme heights visited by man, and effect of height.

B. GEOGRAPHICAL CONFIGURATIONS:

1. Plateaux and lakes. 2. Passes. 3. Peaks.

C. PHYSICAL PHENOMENA:

1. Snow-fall, snow-line, and glaciers. 2. Limits of vegetation and animal life.

Within these primary groups, the materials are also subdivided for the different geographical regions, as: *India*, the *Himálaya*, *Western Tibet*, and parts of the

Karakorúm and *Kuenlúen*.¹ We have added, moreover, as an aid to comparison, some analogous data for the *Andes* and the *Alps*, limiting their number, however, as much as possible, in order not to deviate too widely from the immediate object in view.² For the *Andes*, the celebrated "Voyages aux régions équinoxiales" by Humboldt, have long furnished materials which possess to this day the highest value and importance; and in his recent publications,³ the newest contributions of science have been added with a master's hand.

The physical and geological features of the *Alps* have been treated by Hermann and Adolphe in two volumes,⁴ containing data of physical geography, partly the result of their own observations, and partly collected from the works of preceding observers.

A. THE DIFFERENT VARIETIES OF HABITATION.

1. TOWNS, VILLAGES, AND PASTURE GROUNDS.

India, with its large population,⁵ has a great many towns, as well in its mountainous districts, as in the more frequented plains. The majority of elevated towns and villages is to be found in Maissúr, where they are situated in great number at a height of 2,000 or 3,000 ft. (Bangalúr 2,949 ft., Seringapatám 2,558 ft.). The Dákhan follows next in order of elevation (Satára 2,252 ft., Aurangabád 1,855 ft.). In Málva, Berár, and Bahár, none of the larger places reach the height of 2,400 ft. (Seúni 2,133 ft., Sagar 1,880 ft.); while the principal stations of the Pānjáb are lower still (Raulpíndi 1,737 ft., Peshaúr 1,280 ft.).

The extreme elevations attained by the various mountain-systems are not so excessive, that habitation in these tropical regions can be said to be limited by the modifications of climate as occasioned by height. On the contrary, the prominent peaks

¹ In order to avoid repetition, and to present the materials in a condensed, and, therefore, comparable form, the names of the observers, the latitude and longitude, and other topographical details are omitted here; they may be easily found by reference to the "Alphabetical Register of Heights," pp. 506-25.

² For a general treatment of the subject, we may refer to the well known physical Atlas by A. K. Johnston.

³ "Ansichten der Natur," 1849, 3rd edition, and "Kleinere Schriften," 1853.

⁴ "Untersuchungen über die physikalische Geographie und die Geologie der Alpen." Vol. I., 1850; Vol. II., 1854.

⁵ A very accurate and careful map, showing the density of population in various districts, is contained in Dr. A. Petermann's "Geographische Mittheilungen," 1857.

and high plateaux, from which rivers take their origin, such as the Samanála, or Sripáda (Adam's peak) in Ceylon (7,385 ft.), the Parisnáth in Bahár (4,469 ft.), the plateau of Amarkántak in Málva (3,590 ft.), have for a long time been crowned with temples and shrines, richly appointed with numerous establishments of priests, to which multitudes of fakirs and pilgrims are annually induced to resort. The highest point in India, the Dodabétta peak (8,640 ft.), is permanently inhabited by a few natives who have been enlisted in the service of science, and are regularly charged with making meteorological observations.¹

For Europeans, the decrease of temperature with elevation offers conditions for the establishment of *sanitariums*, one of the most efficient means for preserving health in the midst of tropical climes. The highest settlements of this kind are those of Utakamánd in the Nilgiris (7,490 ft.), and Nurélia in Ceylon (6,218 ft.).

The *Himálaya* rises, in general, so abruptly above the plains, and the latter, particularly in the western regions, are in themselves of such an elevation, that, even in the lower parts of the valleys, there are but few, if any, points of less altitude than 1,000 ft. above the level of the sea. Two causes, more especially, have tended to displace the order of population in these districts, the lower parts being almost exclusively deserted in favour of the lands lying immediately above. In the first instance, the prevailing steepness of the country hereabouts, which is considerably increased by the erosion of the rivers, precludes the successful cultivation of the soil; and, again, from the swampy and malarious character of the large hill-side forests (*tarái*) skirting the extremities of the valleys, the neighbourhood is rendered as uninhabitable to the tribes of the Central *Himálaya* as to the highly susceptible and less seasoned visitor from European climes. Consequently, in the inferior stratum of heights, ranging between 2,000 and 3,000 ft., the number of places inhabited by the natives is comparatively insignificant; while population reaches its maximum in the rich belt of life rising from 3,000 to 8,000 ft., the traces of man and his dwelling-place beginning rapidly to disappear at 11,000 ft. and even before.

The *highest limits of habitation*, however, very often present themselves under a form which almost excludes the possibility of strictly comparing them as dependent upon climate. It is a remarkable fact, that in some provinces of the *Himálaya*,

¹ See T. G. Taylor's "Meteorological observations made on Dodabétta." Madras, 1848.

especially in Nepál, Kámáon, and Gárhvál, many villages are deserted in winter, though as far as regards their elevation, and the solid construction of the houses, they might very well be inhabited throughout the year. The natives, however, prefer removing to villages less elevated, where they spend the colder months.

The Alps of Europe also present instances of this kind in Findelen (7,192 ft.), Breuil (6,594 ft.),¹ and many other summer villages of greater or less elevation on the French side of the Alps. In the Himálaya west of Gárhvál such modifications do not occur; at least, we are not aware of the existence of villages in Símla, Kúlu, Kisht-vár, &c., where the inhabitants follow the nomadic example furnished in other parts of the hill-country.

Châlets (*Alpenhütten*) are as little used in the Himálaya, as *tents* in the Alps. The pasture grounds, "Kárik", for sheep and bovine cattle, are, for the most part, in low elevations, and at no great distance from the villages. In the frontier country bordering Tibet, herds of sheep and goats are used for the transport of merchandize. They are driven over the passes to Tibet, laden with grain (a full grown sheep carrying about seven pounds), and return at the end of the summer with salt and borax.

The *sanitariums* in the Himálaya (Símla 7,156 ft., Darjiling 6,905 ft., Mässúri 6,849 ft., &c.) are at present confined to the outer ranges, at a distance of 40 or 50 miles from the foot of the mountains. Though the interior of the Himálaya would afford, perhaps, many spots more desirable in point of coolness and dryness, the want of roads has hitherto rendered all approach exceedingly difficult, and to an invalid even dangerous. But we may hope at a future time to see sanitariums founded in more central situations. A beginning has already been made with Chíní, a most salubrious place in Kánáur (9,096 ft.), which has been connected with Símla by a road executed by order of Lord Dalhousie. Also Srinágger,² the capital of the valley of Kashmir (5,146 ft.), has of late become easy of access from several parts of the Pánjáb.³

¹ Hermann and Adolphe: "Physikalische Geographie der Alpen." Vol. II., p. 582.

² In the summer of 1861 there were in Kashmir about three hundred visitors, including ladies and children. *Delhi Gazette*.

³ Quite recently, Captain Urmston has been deputed to form a committee and proceed to the north side of the great Chámbera range, to ascertain if a sanitarium out of range of the periodical rains can be formed there. *Allen's Indian Mail*, Nov. 21, 1861.

Western Tibet is a country of such general elevation, that, only in the province of Bálti, villages are to be found below a height of 6,000 ft. As a whole, Tibet is very thinly populated; the greater portion of the inhabitants living at heights varying between 9,000 and 11,000 ft. In some of its provinces, more especially in Gnári Khórsum, and, if we may judge from the travels of Hue and Gabet, in the eastern parts of Tibet also, remains of former habitations may often be observed in places now nearly deserted. Their appearance would give rise to the belief, that the country formerly had a more numerous population than it can show at the present day. One of the principal causes of this marked change may be looked for in the long continued pressure of the Chinese upon these countries.

Some of the chief towns of Tibet have been built at considerable elevation; Leh, the capital of Ladák, and one of the most important commercial places of Western Tibet, lies 11,527 ft. above the level of the sea. We find villages, hamlets, and other dwelling places permanently inhabited, which may be ranked among the highest abodes of man, not only in High Asia, but even in the world at large. Indeed, such are the extraordinary elevations at which they have been discovered, that the assertions of Moorcroft — in 1812 one of the first explorers of the western parts of Tibet¹ — were at first received with a certain degree of incredulity. For ourselves, however, we have been enabled, by the labours of our predecessors and the results of our own travels, to select the villages of extreme height from a sufficiently large number of determinations.

The *highest permanently inhabited places* are Buddhist monasteries, the most elevated being probably that of Hámle, in Ladák (15,117 ft.), where about 20 lamas reside. Round the lakes of Mansarúur and Rákus, in Gnári Khórsum, there are also some monasteries, mentioned by Moorcroft and the Stracheys, which we should suppose to be nearly as high as Hámle. It may be recollected as a coincidence, that in Europe, the highest permanently inhabited place is also a monastery, erected on the St. Bernard at a height of 8,114 ft.

Tibet, like the Himálaya, has its *summer villages*. One of them, Gártok, on the Indus, at a height of 15,090 ft., has a special interest attaching to it from the commercial importance of the place. Every year, in August, a large fair is held there, and occasionally visited by several thousands of natives from almost every part of

¹ See "Asiatic Researches," Vol. XII., pp. 375 et seq.

the Himálaya and Central Asia. The houses in Gártok being few in number, the people have to encamp in the black or coloured cloth-tents which they bring with them, enlivening the usual quiet aspect of the place with the appearance of a second and larger town under canvas. This is certainly the greatest height at which man is known to congregate for mercantile purposes.

Some of the other Tibetan summer villages, as Nórpu (15,946 ft.) and Púga (15,264 ft.), are built on sites, near which salt and borax, important export articles for Tibet, are found, and serve only as occasional sheltering places to shepherds.

Tibet has long been famous throughout Asia, and even in Europe, for its numerous herds of sheep and the superior quality of the wool which they provide; with the rearing of these herds many of its inhabitants are exclusively occupied. In summer, the flocks are driven to *pasture grounds*, some of which reach an elevation (15,000 to 16,349 ft.) beyond which the Tibetan shepherds, who sometimes remain upon the mountains from June to September, cannot be supposed to make any permanent residence. Though many cloudless days generally succeed each other in these lofty regions, thus leaving the power of direct insolation unimpaired, the climate always remains bleak; while the prevailing winds not only aggravate the effects of a low temperature, but also that of a low barometric pressure, thus presenting a remarkable modification of climate, of which we shall give some detail in our considerations upon the influence of height in general.¹ The shepherds with difficulty provide themselves with a sufficient supply of fuel for cooking purposes; sometimes they contrive with much labour and pains to erect rude stone walls, behind which they may take shelter during the night. These walls are usually circular in form, from 4 to 5 feet high and without a roof. If the pasture ground happens to be near a glacier, one of the huge stones from the ancient moraines is not unfrequently used as a part of these constructions. Against strong winds more protection is thus afforded than by the black cloth-tents which the shepherds often carry with them.

In the *Kuenlúen*, even the foot of its southern (Tibetan) slopes is so elevated, that no villages or pasture grounds exist at all; by combining with our own observations a variety of reports received, we obtain for its northern slopes 9,400 ft., as

¹ See p. 483.

the limit of *permanently inhabited villages* (Búshia 9,310 ft.); *summer villages* reach about 10,200 ft., and *pasture grounds* do not occur above 13,000 ft.

In the *Andes*, large and important permanently inhabited places have been built at great heights (Cerro de Pasco 14,098 ft., Potosi 13,665 ft.), and are generally situated on plateaux.

For the *Alps*, we have already had occasion to mention their summer villages.¹ The *highest permanently inhabited villages* are in the valley of Avers in Graubünden, where Juf lies at an elevation of 7,172 ft., and that of Cresta exceeds 6,700 ft. But the roads, leading across the passes, have rendered it necessary to construct houses near the top which are permanently inhabited; the highest of these at present being the well known monastery of St. Bernard (8,114 ft.). As long as the road over the Stelvio was kept up, Santa Maria (8,146 ft.) was also inhabited throughout the year.

The *pasture grounds* in the Alps, which are generally in the neighbourhood of Châlets (Alpenhütten), may be met with at heights of 8,000 ft. and upwards; the Fluhälpe on the Findelen glacier near Monte Rosa (8,468 ft.), and the Torrenthütte in the Anniviers valley (8,412 ft.), being instances of the greatest elevations.

2. EXTREME HEIGHTS VISITED BY MAN, AND EFFECT OF HEIGHT.

Temporary habitations, frequented for some months, as we have seen in the table of the highest pasture grounds, sometimes reach a height of nearly 16,500 ft.; the shepherds' tents and the stone-walls of Tibet being most probably the highest of their kind on the globe.

As far as our personal experience goes, we may state, that, for short periods of ten or twelve days, man may considerably exceed this height, not without suffering, but at least with no positive injury to himself. During our explorations of the *Íbi Gámin* glaciers, August 13 to 23, 1855, we encamped and slept during these ten days, in company with eight men (Bhútias from Milum and Tibetans), at very unusual heights. During this period our lowest camp was pitched at 16,642 ft.; our highest at 19,326 ft.—the greatest height at which we ever passed a night;⁴ another was at 19,094 ft., two camps exceeded 18,300 ft., and the remainder ranged between 18,000

¹ "Ansichten der Natur," Vol. I., p. 349.

² Pentland's Map: "La Laguna de Titicaca and the valleys of Yucay, Collao, and Desaguadero." London, 1848.

³ "Ansichten der Natur," Vol. I., p. 137. Santa Barbara, a mine with houses, near Huancavelica, is 14,508 ft. high.

⁴ By way of comparison with European proportions, we may mention, that this is very nearly twice as high as the Zugspitze (9,692 ft.), the highest peak in the Bavarian Alps.

and 17,000 ft.¹ Apart from the extreme elevation and consequent cold, the bodily exertions imposed upon us during our stay proved a great tax upon our powers. Once we crossed a pass of 20,459 ft., and three days earlier, Aug. 19, 1855, we had ascended the flanks of Íbi Gámin to a height of 22,259 ft.² This, as far as we know, is the greatest height yet reached on any mountain, though below that to which man has risen in balloons.³

On the Sáassar peak we attained (Aug. 3, 1856) an elevation of 20,120 ft.⁴ As early as 1818, however, the brothers Alexander and James Gerard ascended (Oct. 18) a peak in Spíti 19,411 ft. high, not far from the Porgyál, or Tazhigáng.⁵

From a memoir just published by Captain T. G. Montgomerie, whose important labours in connection with the operations of the G. T. Survey we have had repeated opportunities of acknowledging, we learn that a *station* of 19,979 ft. has been reached twice by Mr. W. H. Johnson, and another 19,958 ft. in height by Mr. W. G. Beverley. A *trigonometrical mark* has also been erected on a point 21,480 ft. above the level of the sea, "but unfortunately there was not sufficient space to put a theodolite on it."

In the *Andes* Humboldt ascended the flanks of Chimborazo (June 23, 1802)

¹ In the *Alps*, Hermann and Adolphe once remained in the Vincenthütte, on the southern slopes of Monte Rosa, for 14 days, at a height of 10,374 ft. (see "Phys. Geogr. d. Alpen," Vol. II., p. 83). On another occasion they passed a night on the Rothsattel (10,927 ft.), which unites the Finsteraarhorn with the Rothhorn; and Hermann also stayed two days and a half on the Col St. Théodule (11,001 ft.). Here, they merely suffered at times from the cold, the effect of rarefied air not being felt at such a height, nor does it indeed make itself apparent, under ordinary circumstances, even on the loftiest peaks of the Alps. The well known English professors, Tyndall and Frankland, even passed the night of August 21, 1859, on the top of Mont Blanc (15,784 ft.).

² See p. 334. With his usual amiability, Humboldt sent to our brother Emil, then staying in Berlin, the following lines, in which allusion is made to our ascent of the Íbi Gámin: "Ihre Brüder waren also in Tibet, am Abhange "des Íbi Gámin 20,886 Par. Fuss hoch, nicht blos höher als ich und Boussingault am Chimborazo, sondern 786 Par. Fuss "höher als dieser." (So your brothers have reached in Tibet, on the slopes of Íbi Gámin, the height of 20,886 French feet, being not only higher than I and Boussingault got on the Chimborazo, but 786 French feet higher than this mountain itself). We could not adduce a more apposite instance of Humboldt's simple and truly scientific character than is presented in this passage.

³ The height hitherto attained in *balloons* little exceeds 23,000 ft. We refer more especially to the well known ascent of Gay-Lussac, performed as early as the beginning of this century (Sept. 16, 1804), when he rose to 23,020 ft. (see "Humboldt's Essai sur la géographie des plantes," Paris, 1807, p. 145.), and also to the subsequent attempts of Bixio and Barral. Within the last few years ascents have been made in England, in connection with experiments instituted by a scientific committee, among whose members it is sufficient only to name Sabine and Sykes. See "Philosophical Transactions," 1853, part III.

⁴ See p. 422. A view of the Sáassar pass, in which the peak in question appears, is given in our *Atlas of Panoramas and Views*. See plate No. 7.

⁵ "Account of Koonawur by Capt. A. Gerard." Edited by G. Lloyd. 1841, p. 291. Subsequently, Aug. 31, 1821 (?), Dr. J. G. Gerard reached 20,400 ft. "As. Res.," Vol. XVIII., part II., p. 254.

to a height of 19,286 ft.,¹ this being the extreme elevation attained at that period. Some years afterwards (Dec. 16, 1831) Boussingault reached, on the same peak, a height of 19,695 ft.²

The *effect of height* is chiefly perceptible in the decrease of temperature and barometric pressure. The temperature, on such days at least as must be selected for reaching extreme heights, differs not considerably for the chains of High Asia, if compared with the Alps, the difference of latitude nearly compensating for the inequality of height. But the decrease of pressure is in direct proportion to the absolute height.³ There are certainly other modifications of the atmosphere connected with height, such as moisture, chemical composition, electricity, &c.; but these varying within limits so narrow as to necessitate the application of instruments for their detection and definition, do not affect the human frame in any unusual degree.

Although, from optical phenomena, 70 or 80 English miles have been approximately assigned as the extreme upper limit of the atmosphere, the decrease of density is so much greater in the lower strata that, even at an elevation of 22,200 ft. (so trivial a proportion of the entire assumed distance), we observed a barometric pressure of 13.364 inches, so that nearly $\frac{3}{4}$ ths of the weight of the atmosphere lay below the point reached by us at the time. At the height of about 18,600 or 18,800 ft., the atmospheric pressure is $\frac{1}{2}$ of that at the level of the sea.

It is evident that there must be a limit beyond which the degree of rarefaction is incompatible with the conditions of human existence; but it will ever remain extremely difficult, if not altogether impossible, to determine the line of demarcation with any approach to scientific precision. There are many and variable elements to be taken into account. Among others, the general state of health of the individual observer, his power of resistance, and of adaptation to new conditions, the time spent at these unusual heights, and the more or less favourable progress of inurement to the effects of diminished atmospheric pressure, are all conditions of great moment in affecting every particular result.

¹ "Kleinere Schriften," p. 151. The height of 19,286 ft. is the definitive value deduced by Humboldt after a careful re-calculation. The height he had formerly obtained was 19,388 ft. See his "Essai sur la géographie des plantes." Paris, 1807, p. 145.

² Ibid. p. 157.

³ The variation of pressure, as dependent upon the region of the globe, is not important enough to deserve more than a passing recognition, when considering such unusually low readings of the barometer.

The degree of motion of the atmosphere (the wind) exercises, we found, so marked an influence as to deserve more particular notice hereafter.

As to the beneficial effect of acclimatisation, we can speak from our own personal experience. In going over passes of 17,500 and 18,000 ft. for the first time, we felt considerable inconvenience and distress; a few days later, after crossing several of the higher passes, and spending some nights on these heights, we found ourselves on the whole tolerably free from the usual unpleasant symptoms, even at heights of 19,000 ft. What might have been the consequence had we prolonged our stay in these lofty regions¹ it is impossible to say, the probability, however, being that a longer sojourn would have told severely upon our health.

The influence of height varies with the individual, a man in good health having the chance of less suffering. The difference of race has apparently no appreciable importance. Our Hindu servants, who, though not following us up to the greatest heights, yet had to cross the passes, suffered far more from the cold than our Tibetan companions, though not more from the diminished pressure. For the generality of people the influence of height begins at 16,500 ft., a height nearly coinciding with that of the highest pasture-grounds visited by shepherds. Of the tame animals brought with us, the horses and camels alone evinced decided symptoms of suffering from the rarefaction of the air, though these were not observable at a height of less than 17,500 ft.

The complaints produced by diminished pressure are: headache, difficulty of respiration and affection of the lungs, the latter even proceeding so far as to occasion blood-spitting;² want of appetite and even sickness, muscular weakness and a general depression and lowness of spirits. All these symptoms, however, disappear in a healthy man almost simultaneously with his return to lower regions. The effects here mentioned were not sensibly increased by cold, but the *wind* had a most decided influence for the worse upon the feelings. As this was a new phenomenon to us, and one that we had not hitherto found mentioned by former observers, we directed our particular attention to it, and remarked instances where fatigue had absolutely nothing to do with it. In the plateaux of the Karakorúm it was a common occurrence, even

¹ We allude here more especially to our excursions in the environs of the Íbi Gámin peak. See pp. 481-2.

² Bleeding of the nose, we experienced ourselves, though very rarely, the loss of blood on such occasions being insignificant; but bleeding of the ears and lips we neither experienced personally nor observed in others.

for the sleepers in the tents, where they might be considered as somewhat protected, to be waked up in the night with a heavy feeling of oppression, the entire disturbance being traceable to a breeze, not even a very strong one, which had sprung up during the hours of rest. When occupied with observations, we took very little, if any bodily exercise, sometimes for 36 hours, and the attendants still less than ourselves; it would frequently occur, nevertheless, even in heights not reaching 17,000 ft., that an afternoon or evening wind would make us all so sick, as to take away every inclination for food. No dinner was cooked; the next morning, when the wind had subsided, the appetite was the better. As a rule, we were less affected in the morning than the evening, though the inference to be derived from this observation must doubtless be influenced by the circumstance, that high breezes generally sprang up in the afternoon, even on favourable days and during the continuance of fine weather.

The effects of diminished pressure are considerably aggravated by fatigue. It is surprising to what a degree it is possible for exhaustion to supervene; even the act of speaking is felt to be a labour, and one gets as careless of comfort as of danger. Many a time our people—those who ought have served us as guides—would throw themselves down upon the snow, declaring that they would rather die upon the spot than proceed a step further. From common motives of humanity we were then often reluctantly obliged to interfere in their behalf, and to rouse them by force from the stupor into which they had fallen, though at the time we ourselves were scarcely in better spirits than they.

B. GEOGRAPHICAL CONFIGURATIONS.

1. PLATEAUX AND LAKES.

Plateaux, in consequence of their being more or less intersected by deep and broad valleys, or from being covered with ridges, are so variable in their form, that the use of the name, in many instances, appears to be somewhat arbitrary. We prefer not to extend the meaning of the name too far, and in so doing diverge from the practice of earlier travellers, who commonly applied the term to every mountainous region of great *general* elevations—as the natives of the *Himálaya* have a tendency to do—irrespective of its form.

In *India* there are many plateaux, which, for the most part, lie in the *Dékhan*, *Maissúr*, and *Málva*; they are well defined, but of low elevation, and very limited in extent as compared with those of the *Andes* or *Turkistán*. Among the most important are *Mahabaléshvar* (4,500 ft.), *Amarkántak* (3,590 ft.), and *Kondikóna* (3,070 ft.).

In the *Himálaya*, which is composed in almost every direction of lofty and irregular ridges, and intersected by numerous valleys of inconsiderable width, no plateau of any extent has been discovered as yet, nor is it at all probable, that one exists.

Western Tibet was for a long time supposed to be little else than a country of plateaux—an erroneous impression emanating from the first observers, though Humboldt, with his usual sagacity, had early pointed out the error of this belief.¹ Plateaux certainly do occur in *Tibet*; they are, however, much less numerous and considerably smaller than we had been led to expect.

Tibet may be best described, in short, as a longitudinal valley included between the *Himálaya* and *Karakorúm*, and covered with many lateral ridges.

In its *eastern part* it is drained by the *Dihóng*, an affluent of the *Brahmapútra*. The height of its capital, *Lhássa*, may be estimated at 10,000 ft.

¹ "Ansichten der Natur," Vol. I., p. 104.

Its *central part* is formed by the gradual rising of the ground in the environs of the lakes Mansaráur and Rákus Tal, the average height being 15,400 ft.

The *western part* is drained by the Indus and Sítlej rivers, with their affluents; it comprises Gnári Khórsum, Ladák, and Bálti. The principal towns of these provinces are: Gártok (15,090 ft.), Leh (11,527 ft.), and Skárdo (7,255 ft.).

The unusual height of some of the valleys of Western Tibet, as compared with those in other parts of the globe, may not improbably have a considerable share in the erroneous belief deduced from early reports as to this country being almost exclusively a plateau.

Instances of two river-systems belonging to one general longitudinal depression are not unfrequent on a minor scale, though Tibet must be considered perhaps as the largest form of this kind. In the Alps, the Upper Engadin with the Val Bergell, and the valley of the Vorder-Rhine with that of the Rhône, can be mentioned as somewhat analogous.

Between the *Karakorúm* and the *Kuenlúen*, especially near the western crest of the former, several well defined plateaux of extraordinary height occur. Some of the highest are called: Dápsang (17,500 ft.), Búllu (16,883 ft.), Aksáe Chin (16,620 ft.), Voháb (16,419 ft.). In Bálti, the plateau Deosái is 14,200 ft. high.

In the *Andes* are to be found, if not the highest, at least the most extensive plateaux of our globe, which generally lie along the very ridge of the mountains. Their average heights differ but little from those of the towns mentioned above.¹

There is also a large plateau surrounding the elevated lake Titicaca (12,843 ft.).

In the *Alps*, plateaux occur only at their base; the Swiss plateau having a mean height of 1,460 ft., the Suevo-Bavarian plateau of 1,420 ft.² It is here that the principal Alpine lakes are situated. In the *Himálaya* there are no such picturesque plains adorning the foot of the mountains. The watershed between the Indus and the Ganges is altogether upon a lower level, and no connection with the *Himálaya* exists, similar to that between the Swiss plateau and the Alps.

Lakes are comparatively rare in *India*, but large "Jhils" are occasionally to be seen, especially in the river systems of the Ganges and Brahmapútra. For the most

¹ See p. 481.

² Hermann and Adolphe: "Phys. Geogr. d. Alpen." Vol. II., p. 577.

part they are not very deep; their surface is very variable, and many of them are entirely dry during the hot season. *Tanks* are frequently met with; their numbers throughout the country testify the importance attached to them by the natives. Some of the tanks in Maissúr and the Karnátik are of surprising dimensions.

In the *Himálaya* also, there are but very few lakes. That of Nainítal, in Kámaon (6,520 ft.), the Vúllar lake, in Kashmír (5,126 ft.), and the Chinár lake, near Srinágger, at about the same height, suffice to exhaust the category of those deserving mention.

Glacier lakes—accumulations of water formed by one glacier obstructing the outlet of a higher one—are of much more frequent occurrence. At times, the wall of ice breaks away before the pressure of the swollen waters, when the lower lands become suddenly inundated, and the torrent rushes on with uninterrupted violence for miles, exercising a marked influence even down to the lower parts of the rivers.¹ Two of the most elevated glacier lakes are the Déo Tal, in Gárhvál (17,745 ft.), and the Nántso, or Yunám, in Lahól (15,570 ft.).

Western Tibet and *Turkistán* possess many lakes, all of which are situated in great heights; they are, however, gradually drying up, as becomes apparent by the unmistakable marks of larger surfaces remaining from former times. They contain a greater quantity of salt than lakes in general, and most of them to an amount which renders them more or less brackish. The water of some, however, is still drinkable; among these we particularly mention the Hánle and the Upper Tsomognalari lakes.²

LAKES OF WESTERN TIBET AND TURKISTÁN.

Aksáe Chin	16,620 ft.	Níma Kar.	15,100 ft.
Tso Gyagár	15,693 „	Hánle	14,600 „
Tso Kar, or Kháuri Taláu	15,684 „	Tso Gam	14,580 „
Múre Tso	15,517 „	Tso Rul.	14,400 „
Kiúk Kiöl.	15,460 „	Tso Mithál	14,167 „

¹ Similar inundations, some of them of a most destructive character, have several times occurred in Tibet. See "Vigne's Kashmír," Vol. II., p. 362, "Cunningham's Ladák," pp. 99, et seq., and "Capt. Montgomerie's Memorandum."

² See the diagram of the Lakes: plate VI. of the "Panoramic Profiles of the Snowy Ranges of High Asia."

PASSES.

In *India*, the highest pass is the Sígur, in the Nilgiris (7,204 ft.). The Rangbódde pass, in Ceylon (6,589 ft.), is little inferior in height. Of the numerous passes (Ghāts) occurring in the Western Ghāts, the Bapdéo and the Katrúj both exceed 3,000 ft., the former being 3,499 ft., the latter 3,019 ft.

For *High Asia*, the mean of a sufficient number of such passes which lead over the three principal crests is particularly to be taken into consideration, it being approximatively proportional to the mean height of these crests. The passes situate in the lateral ramifications of the principal crests—though they are numerous—cannot be included in these general means, being geographically of subordinate importance.¹

The mean height² of passes is as follows, the values being based on the heights contained in the table at p. 492.

a. FOR THE HIMÁLAYA 17,800 ft.

From Sikkim to Kishtvár; Bhután and Kashmir being excluded; the former for want of materials, and Kashmir on account of the Himálaya there losing the character of one well defined and predominant chain.

b. FOR THE KARAKORÚM 18,700 ft.

We have data only from Long. E. Gr. 76° to 79½°, the heights in the eastern continuation being quite unknown.

c. FOR THE KUENLÚEN 17,000 ft.

Here we know the height of two passes only. As they are situated, however, in parts not differing, in any important particular, from the general character of this chain, they may be looked upon as representatives of the others.

From these numbers it appears, that the Karakorúm has by far the greatest mean height of passes; but the one pass which we must still consider the highest is situated in the Himálaya. This is the *Ibi Gāmin pass* (20,459 ft.), leading from Gārhhvál to Gnári Khórsum, which we crossed August 22, 1855. It is known to the natives of Mána and Bádrinath, some of whom, about 36 years ago, once ventured to cross it with their laden sheep. The Mána pass at that time was infested by

¹ We have had occasion to cross one pass of above 20,000 ft., one above 19,000 ft., six between 19,000 and 18,000 ft., nine between 18,000 and 17,000 ft., &c.

² The precise figures are: Himálaya 17,789 ft., Karakorúm 18,721 ft., and Kuenlúen 16,999 ft.

robbers, and the difficulties encountered, as also the loss of sheep and merchandize experienced on this occasion, were so considerable as to induce the natives to give up all idea of using the route as a commercial road.

Some comparisons with other and more familiar instances of elevation will tend to furnish a more adequate idea of the extraordinary height of this pass. The one coming nearest to *Íbi Gámin* in height, the *Mustágh* pass in *Báiti*, is 1,440 ft. lower. We may remark incidentally, that the *Íbi Gámin* pass is only 1,800 ft. below the highest point attained by us on the peak of the same name. This pass exceeds the highest in the Andes by 4,869 ft., *Mont Blanc* by 4,676 ft., and the highest pass in the Alps by 8,580 ft.

The *Mustágh* pass (19,019 ft.) and the *Íbi Gámin* pass (20,459 ft.) are, however, the only two as yet known above 19,000 ft. The third in height is the *Changchénmo*, (18,800 ft.), in the *Karakorúm* chain, but none of these, it should be borne in mind, are generally used, or crossed as commercial roads; they are evidently too high and too difficult of access. The highest pass as yet known to be regularly crossed with horses and sheep, for the purposes of commerce, is the *Párang* pass, in *Spíti* (18,500 ft.); and between this height and 18,000 ft. are situated several of the most important and frequented passes, as the *Mána* (18,406 ft.), the *Karakorúm* (18,345 ft.), and the *Kióbrang* (18,313 ft.). Over none of these, or other high passes, however, does anything lead at all approaching to the European idea of a road. Though below the glacier region a kind of foot-path is certainly discernible—very often a row of small stripes running parallel to each other—yet as soon as a glacier is ascended, or one of its ancient or present moraines, all such traces at once disappear. The general direction to be taken is indicated by stones, not unlike glacier tables, which the natives place along the line of route as way-marks; though in many parts, as on the *Turkistání* road, north of *Ladák*, the uncertainty about the path to be followed is often removed by the appearance of the numerous skeletons of beasts of burden which distinguish the tracks of former caravans.

The *Himálayan* passes above 16,000 ft. are invariably closed by snow during the winter months between November¹ and May; even in the beginning of June, it is extremely difficult to cross a pass above 17,000 ft.

¹ In December, 1845, when the Chinese fought a battle near *Tirthapúri*, in *Gnári Khórsum*, the garrison of *Tákla Khar* fled across the pass near the head of the *Káli* river. Even in this unopposed flight, one half of the men were killed by frost, and many of the remainder lost their fingers and toes. See "*Cunningham's Ladák*," 1854, p. 353.

In the Karakorúm, the snow-line is so elevated, and the absolute quantity of snow falling so small, even in winter, that the passes are never entirely closed. The Karakorúm can thus always be crossed even with horses, and the caravan road from Ladák to Turkistán accordingly remains passable throughout the year, though during the cold season, in order to avoid the Süssár pass,—one of the most difficult parts of this route even in summer—the merchants prefer going up to the Karakorúm along the Shayók river.

In the Kuenlúen, all passes above 15,000 ft. are, as we heard, closed in winter by the heavy snow-fall.

In the *Andes*, the general mean elevation of the passes is, according to Berghaus:¹

For the Western Andes . . . 14,500 ft.

For the Eastern Andes . . . 13,500 „

The highest passes are: Alto de Toledo (15,590 ft.)², Lagunillas (15,590 ft.)² and Assuay (15,526 ft.)³.

In the *Alps*, we adopted as the mean for the passes. . . 7,550 ft.

As the highest pass, at least in former times, not unfrequently used for commercial purposes, we may refer to the St. Théodule pass (11,001 ft.)⁴. There are, however, besides *indentations* (*Scharten*) practicable for travellers, which are considerably higher,—exceeding 12,000 ft. Among others is the Old Weissthör, which we found to be 11,871 ft.⁴; another pass, the passage to Saas, recently called the New Weissthör, is marked on our map of Monte Rosa with the height of 12,136 ft. The height of the Col du Géant in the Mont Blanc group is 11,197 ft.⁴

------------------------	--------	---------------------------------------	--------	---------------------------------------	--------

¹ These two passes cannot be used for practical purposes.

3. PEAKS.¹

In *India*, the highest peak, Dodabétta (8,640 ft.),² is situated in the Nilgiris, in Southern India.

Of the peaks in the central parts of Ceylon, the Póduru tálla gälle reaches about the same height, rising up to 8,305 ft.; the well known Samanála, or Sripáda (Adam's Peak), attaining 7,385 ft.

In the mountain chains of Central India, in the *Vindhya* and *Araválli* ranges, the peaks are considerably lower (Ábu, 3,850 ft., Rajmirgárh, 3,753 ft.).

The Kalsubái, the highest peak of the Dékhan, attains only 5,410 ft..

High Asia. In the beginning of this century the Andes were supposed to contain the highest peaks on our globe, and Chimborazo to rise supreme above the rest. Though, as early as 1816, this was proved by Captain Webb's measurements to be incorrect, yet some time elapsed before the superiority of the Himálaya above the Andes was generally admitted. At present (Nov. 1861) the number of peaks on the ranges of High Asia that are known to exceed the highest summit of the Andes, is remarkably great, amounting to forty-five.

In the *Himálaya*,³ Gaurisánkar, or Mount Eyérest (29,002 ft.), is the highest peak in the world yet discovered; it is 6,000 ft. higher than the dominating peak of the Andes, and 13,220 ft. above the most elevated parts of the Alps.

In the *Karakorúm*, peaks have lately been discovered which are scarcely inferior in height to the loftiest in the Himálaya, though only its western part has as yet been explored. With regard to the heights of its eastern continuation, there is not enough known to allow even of an estimate being made.

The highest peaks of the Karakorúm are the Dápsang (28,278 ft.), the Diámer (26,629 ft.), and the Masheribrúm (25,626 ft.).

With reference to the *Kuenlúen*, we can only mention the peaks that we saw between the Yurungkásh pass and the western termination of this chain; our idea

¹ We here exclude, as not properly belonging to the regions to be compared, the countries north-east of Assám, with the Gri peak (15,800 ft.), and the Sólíman range to the west of the Indus, of which the highest peak, the Suféd Koh, rises to 14,839 ft.

² At its top there is a small observatory. See p. 475.

³ Notwithstanding their great elevation, none of the peaks of the Himálaya are visible from the sea, in consequence of their continental position.

about the general height is the more limited, as we have not even itinerary reports of former travellers to assist us. None of the peaks seen there by ourselves exceeds 22,000 ft.

Our volume contains the geographical co-ordinates (latitude, longitude, and height) of 132 peaks belonging to these three mountain ranges, which exceed 20,000 ft. in height, while one of them actually reaches 29,000 ft. (Gaurisáñkar, or Mount Everest), and two range between 29,000 and 28,000 ft. (Dápsang and Kanchinjínga).

The relative numbers of the others are:

Relative Numbers.	From Feet.	To Feet.	Relative Numbers.	From Feet.	To Feet.
2	28,000	27,000	14	24,000	23,000
6	27,000	26,000	26	23,000	22,000
10	26,000	25,000	23	22,000	21,000
10	25,000	24,000	38	21,000	20,000

In the *Andes*, important alterations have very recently been made with reference to the succession of the peaks, when arranged according to height, and even now the same amount of accuracy cannot be ascribed to the hypsonometrical determination of its principal peaks¹ as to the trigonometrical operations in the *Himálaya*. The highest peak in the *Andes* is the Aconcagua (23,004 ft.); and there are as many as five peaks higher than the Chimborazo (21,422 ft.).

In the *Alps*, Mont Blanc (15,784 ft.) and Monte Rosa (15,223 ft.) are well known to be the highest peaks. In the tables of comparison, we have added a list of peaks above 14,000 ft., but have given the highest summit only in every group, in order not to extend the space unnecessarily.

¹ Humboldt's urgent wish to see these heights re-determined has not yet been realized. See his "Kleinere Schriften," p. 158.

TABLE OF THE PRINCIPAL PEAKS.

C. PHYSICAL PHENOMENA.

1. SNOW-FALL, SNOW-LINE, AND GLACIERS.

Snow-fall in India Proper, has, we believe, never been recorded, not even a sporadic fall on the top of its highest peak, the Dodabétta (8,640 ft.).

In the *Himálaya*, the lowest height at which snow has fallen in winter is about 2,500 ft.; but such cases are extremely rare, having occurred in Kāmáon and Gārhvāl only twice (in 1817 and 1847), since the British took possession of the country.¹ At an elevation of 5,000 ft. scarcely one year in ten passes by without snow-fall; but at this height the snow disappears after a few days, and sometimes even hours. "It snows, but one does not see it," the natives of Kathmándu (4,354 ft.) told us; meaning, that the rare nightly snow-falls are melted away by the earliest rays of the sun. 6,000 ft. may be assigned as the limit where snow regularly falls in winter with a probability of remaining some time upon the ground.

In *Western Tibet* and in the *Karakorúm*, the general elevation of the country is so great, even in its lowest regions, that no part lies below the limit of hibernal snow-fall. But the quantity of snow actually falling is inconsiderable, and this circumstance it is which forms one of the chief causes, that the passes of the *Karakorúm*—even the highest—remain open throughout the year. In some parts of Tibet, the winter is the only season when atmospheric precipitation at all takes place.

In the *Kuenlúen*, even on its southern slopes, a greater amount of snow is precipitated than on the northern side of the *Karakorúm*, while its Turkistáni (northern) slopes differ still more from the *Karakorúm* in this respect, being visited by very heavy rains and great snow-falls. Even at Káshgar (3,500 ft.), there are said to be several snowy days every winter.

¹ Colonel R. Strachey, in the "Journal of the Asiatic Society of Bengál," Vol. XVIII., p. 309.

The *snow-line*, or the average height where snow remains perpetually throughout the year, has offered unexpected difficulties in its determination for the *Himálaya*. When Webb and Moorcroft first pointed out the general heights reached by the snow-line, when they first discovered the remarkable fact, that, in spite of the influence arising from exposition, the snow-line of the *Himálaya* descends lower on its *southern* (Indian) than on its *northern* (Tibetan) slopes, the statements of these travellers, now proved to be correct in all material points, were discredited by men of science both in Europe and in India. Humboldt, however, was among the first who endeavoured to remove the distrust with which these discoveries were received; he also gave an explanation¹ of the causes which were possibly sufficient to originate so remarkable a phenomenon as this of the unlooked for differences existing between the snow-lines of the Tibetan and Indian slopes. He considers it, "the result conjointly of the "radiation of heat from the neighbouring elevated plains, the serenity of the sky, and "the infrequent formation of snow in very cold and dry air." Of all these causes, however, the last is the most important. The direct insolation, being less interrupted on the Tibetan side, has also its share of influence; but the effect is comparatively small. As the best corroboration of the quantity of snow-fall being the principal cause of the depression on the southern (Indian) slope of the *Himálaya*, may be adduced the fact, that we found the isothermal lines for the year and the summer, which coincided with the snow-line on the Indian side, decidedly warmer than those on a level with the Tibetan snow-line.²

The fact, moreover, of the *Karakorúm*—though on an average 3° farther north—having the snow-line so excessively high on both its slopes, offers another instance of the influence of limited precipitation.

In the *Kuenlúen*, the meteorological conditions also become apparent in the different limits of the snow-line on either side; but here the effect is the reverse of that perceived in the *Himálaya*, the greater precipitation on the "northern" slopes (towards

¹ "Annales de Chimie et de Physique," Vol. XIV., pp. 5—55; "Asie Centrale," pp. 284—327; "Kosmos," Vol. I. p. 358.

² The detail of these calculations will be given in the meteorological part of our publications; they are made on the same principle as that adopted in our work upon the Alps. "Phys. Geogr.," Vol. I., p. 353, and Vol. II., Atlas, plate 22. That the "plains" of Tibet are too distant and inconsiderable to form an element of disturbance in the matter has already been proved by Colonel R. Strachey. See "Journal of the Asiatic Society of Bengal," Vol. XVIII., p. 805.

the plains of Turkistán) lowering the snow-line on that side to a considerable extent.

Although in the Himálaya at large the snow-limit of the Tibetan side does not descend so low as that of the Indian, yet the influence of exposition at once becomes apparent in the ordinary sense, corresponding to these latitudes, if we examine the slopes of a crest or mountain, of which, by the nature of its position, both slopes belong either to the Indian side of the ridge in general, or to the Tibetan side. The many and vehement disputes upon the much discussed subject of snow-limits, have chiefly arisen from the entire neglect of this modification.

The number of data collected in the Himálaya by Jacquemont, Vigne, Hügel, the Stracheys, Cunningham, Thomson, and others, and by ourselves also in the Karakorúm and Kuenlúen (of the latter we have no data whatever for comparison), enables us to present in this place very well defined means for the snow-line. At another place, in connection with our meteorological researches, we shall have occasion to consider the minor modifications and their dependency upon meteorological and local conditions.

The values we obtain for the height of the snow-line on the three mountain chains of *High Asia* are:

a. HIMÁLAYA:		Feet.
Southern (Indian) slopes	16,200	
Northern (Tibetan) slopes	17,400	
b. KARAKORÚM:		
Southern (Tibetan) slopes	19,400	
Northern (along the Turkistáni plateaux)	18,600	
c. KUENLÚEN:		
Southern (facing mountainous ramifications)	15,800	
Northern (facing the Turkistáni plain)	15,100	

For the *Andes*, the snow-limits are, according to Humboldt¹ and Pentland:

	Feet.
Eastern Andes of Bolivia	15,900
Western Andes of Bolivia	18,500
Andes of Quito	15,700

¹ "Central Asien," 1847, Vol. II., p. 165 and 177. See also p. 213, where Humboldt has given a hypsometrical tableau of the snow-limit on both hemispheres.

For the *Alps*, Hermann and Adolphe obtained:¹

	Feet.
Southern slopes	9,200
Northern slopes	8,900
Extremes (near the Mont Blanc and Monte Rosa group). . .	9,800

The existence of *glaciers* in *Western Tibet* was first made known by Vigne, who alludes to them in his "Travels in Kashmír," 1842, in the second volume, p. 285. Colonel Richard Strachey² was the first who proved their existence (in 1847) in the *Himálaya*. The recent date of this discovery will appear the more surprising, when the immense number of glaciers now positively ascertained to be in this region is taken into consideration. The great amount of ice to be met with, even in lower elevations of the *Himálaya*, could not of course entirely escape the observation of previous travellers; these masses, however, they used to designate as "hard-frozen snow-beds," and to consider them as local phenomena, analogous to remains of avalanches.

On the northern side of the *Karakorúm* and in the *Kuenlúen* we also found glaciers having forms identical with those of the *Alps*. Some of them were considerably larger than the glaciers in Europe.

In the *Himálaya*, the lowest glaciers go down to 11,000 and even 10,500 ft.; the Píndari ending at 11,492 ft., the Tintímna at 11,430 ft., the Tsóji at 10,967 ft., and the Cháia at 10,520 ft.

In *Western Tibet* they descend to about the same elevation; thus, the Mustágh to 11,576 ft., the Tap 11,508 ft., the Támi Chúet 10,460 ft., the Bépho glacier near Áskoli even to 9,876 ft. The latter is worthy of notice as a remarkable case of low termination.

In the *Kuenlúen*, the glaciers end probably at heights not much differing from those in *Western Tibet*; at least so we infer from the height of the snow-limit that we had the opportunity of measuring, as also from the general appearance of the upper part of the glaciers we saw during our travels in these regions. The glaciers on both flanks of the Élchi pass presented, however, no instances of particularly deep descent.

¹ Hermann and Adolphe: "Physicalische Geographie der Alpen," Vol. II., pp. 512, 596.

² "Journal of the Asiatic Society of Bengál," Vol. XVI., part II., p. 794, et seq., and Vol. XVII., part II., p. 203, et seq.

In the *Andes*, no glaciers are known to exist.¹

In the *Alps*, the lowest glacier is that of Lower Grindelwald, ending at 3,290 ft.;² but in general 5,000 ft. must be considered as a rather low end of a glacier.

2. LIMITS OF VEGETATION AND ANIMAL LIFE.

a. VEGETATION.

Trees grow very generally in the *Himálaya* up to heights of 11,800 ft., and in most parts there are extensive forests covering the sides of the mountains at but a little distance below this limit.

In *Western Tibet*, we found nothing at all corresponding to a forest. Apricot trees, willows, and poplars, are frequently cultivated on a large scale; poplars, indeed, are found at Mánguang, in Gnári Khórsum, at a height of 13,457 ft., but they are the objects of the greatest care and attention to the lamas.

In the *Kuenlúen*, we found the trees on its northern side not to grow above 9,100 ft. On the southern side, we met no trees at all; here the considerable height of the valleys we passed, excluded them. In the *Andes*, they end at about 12,130 ft.; in the *Alps*, on an average, at 6,400 ft., isolated specimens occurring above 7,000 ft.

The *cultivation of grain* coincides in most cases with the highest permanently inhabited villages; but the extremes of cultivated grain remain below the limit of permanent habitation. In the *Himálaya*, cultivation of grain does not exceed 11,800 ft., in *Tibet* 14,700 ft., and in the *Kuenlúen* 9,700 ft. For the *Andes*, the limit is 11,800 ft.;³ in the *Alps*, some of the extremes are found near Findelen, at a height of 6,630 ft., but the mean is about 5,000 ft.⁴

The upper mean limit of *grass vegetation* in the *Himálaya* is at 15,400 ft.; in *Western Tibet*, nearly the same level as for the highest pasture grounds, 16,500 ft., may be adopted; in the *Kuenlúen*, grass is not found above 14,800 ft.

Shrubs grow in the *Himálaya* up to 15,200 ft., in *Western Tibet* as high as 17,000 ft., and in one instance, at the Gunshankár, even to 17,313 ft. On the plateaux

¹ Humboldt: "Essai sur la géographie des Plantes." Paris, 1807, p. 133. In his later publications also he maintains the same view. See "Central Asien," 1844, Vol. II., p. 167.

² Hermann and Adolphe: "Physicalische Geographie der Alpen," Vol. II., p. 18.

³ Humboldt: "Essai sur la géographie des plantes," p. 144.

⁴ Hermann and Adolphe: "Phys. Geogr.," Vol. II., p. 596.

to the north of the *Karakorúm*, shrubs are found at 16,900 ft., and, which is more remarkable, they occasionally grow there in considerable quantities on spots entirely destitute of grass. As an example, we mention, amongst several others, the Voháb Chilgáne plateau (16,419 ft.), and Δ Bashmalgún (14,207 ft.).

In the *Kuenlúen*, the upper limit of shrubs does not exceed 12,700 ft. Above this height grass is still plentiful; and shrubs being here, as generally everywhere else, confined to a limit *below* the vegetation of grass, the range presents an essential contrast in this respect to the characteristic aspect of the *Karakorúm*.

In the *Andes*, shrubs grow up to 13,420 ft.;¹ in the *Alps*, we found their upper limit to be 8,000 ft., though isolated cases occurred at much greater elevations. As one remarkable extreme, we may mention the growth of Juniper on a rock of the Lys glacier, at 11,164 ft.

The very *extreme limit of phanerogamic plants* appeared in *Western Tibet*, on the north-eastern slopes of the Íbi Gámin pass, at a height of 19,809 ft.; next in order come those of Gunshankár, in Gnári Khórsum, at 19,237 ft. In the *Himálaya*, the highest plants were found at 17,500 ft., on the slopes of the Jánti pass.

In the *Andes*, Colonel Hall found the highest phanerogamic plants on the slopes of Chimborazo, at 15,769 ft.,² consequently 4,040 ft. lower than the Íbi Gámin plants.

In the *Alps*, Hermann and Adolphe³ found an analogous extreme on the southern slopes of the Vincentpyramide at 12,540 ft.

b. ANIMAL LIFE.

Monkeys appear to frequent regions exceeding 11,000 ft. in height, the *Semnopithecus schistaceus* *Hodgs.* ascending higher than others. These monkeys called "Langúrs" by the natives, have been frequently seen, more especially in Gárhvål and Símla, at the height of 11,000 ft., "leaping and playing about at this elevation," as Captain Hutton says,⁴ "while the fir-trees among which they sported, were loaded with snow-wreaths." This species is not known in India, whilst the *Macacus Rhesus* *Audeb.* is met with as well in India (particularly in Bengál and Assám) as in the *Himálaya*, where it frequents heights of about 8,000 ft. In Bhután, Turner mentions having seen a large troop of

¹ Humboldt: "Essai sur la géographie des plantes," p. 144.

² "Kleinere Schriften," p. 169.

³ Hermann and Adolphe: "Phys. Geogr. d. Alpen," Vol. II., p. 80.

⁴ "Journal of the Asiatic Society of Bengál," Vol. XIII., p. 481.

these animals, which are here held in great veneration, but in Western Tibet, and farther to the north, no monkeys have yet been found.

*Tigers*¹ ascend to 11,000 ft. in the Himálaya; they are not, however, seen in Western Tibet, or the Kuenlúen.

Leopards may be met with in the Himálaya and in Western Tibet even at 13,000, or 14,000 ft.; on the Kidarkánta (12,430 ft.) one of our sheep was carried away by such a beast of prey.

The *domestic cat* is common in Tibet.² *Dogs* are the companions of the Tibetan shepherds, whom they follow over passes exceeding 18,000 ft., without apparently any particular difficulty. A great variety of wild species also exist in different parts of High Asia.

Jackals were found by us in the Karakorúm between 16,000 and 17,000 ft. Hodgson mentions two species of foxes in Eastern Tibet.³ *Wolves* are not known to frequent the Himálaya Proper, but they are found in Western Tibet, and once we saw traces on sand close to the Karakorúm pass (18,345 ft.), which our people ascribed to a wolf.

Various species of beautiful *wild sheep* and *ibex*, together with the *kiang* and the *wild yak*, are met with in large herds, on the highest plateaux between the Karakorúm and the Kuenlúen, and we have not unfrequently discovered them crossing sandy gravel-slopes at 19,000 ft., and even at 19,800 ft., a height considerably above the limit of sporadic grass vegetation.⁴

With regard to the *smaller mammalia*, we may add, that some species of *bats* are seen in the Himálaya up to 9,000 ft.; and the Tibetan *hare* has surprised other

¹ The *lion*, though intimately connected with the mythology of High Asia, has been forthcoming, in historical times, only in Kashmir. Bernier, at least, had frequent opportunities of witnessing the chase of this animal, an amusement which was reserved for the emperor Aurángzeb alone. Balfour, "Supplem. Cyclopædia of India," Madras, 1858, p. 326. In *India*, the lion occurs only in Gujrát.

There is also an interesting memoir upon the area over which the lion is found dispersed, in "Ritter's Erdkunde von Asien," Vol. IV., part 2, pp. 628, et seq.

² In the *Andes*, according to M. de Tschudi, cats and the more delicate breeds of dogs cannot be taken up to heights exceeding 12,800 ft. without fatal results, they generally dying in dreadful convulsions.

³ "Journal of the Asiatic Society of Bengal," Vol. XI., pp. 278 and 589.

⁴ Domestic animals, such as sheep, goats, tame yaks, horses, and dogs, follow man across the highest passes between Turkistán and Tibet, the two-humped Bactrian camel even being used as a beast of burden. When they were without a load, we experienced no difficulty in bringing these camels even over the steeper passes of the Himálaya.

travellers¹ and ourselves at heights exceeding 18,000 ft., and especially along the road over the Karakorúm pass, where they may almost be said to be numerous.

Migratory birds are not known to cross the Himálaya, as many birds of Europe cross the Alps. Those found at the highest elevations are birds of prey, eagles and vultures being occasionally seen at heights of 22,000, or 23,000 ft. The *Tibetan raven* may be considered their next successor in point of the heights frequented by them. When we were in the neighbourhood of the Íbi Gámin, at an elevation between 16,000 and 22,000 ft., some of these birds followed us for six days to pick up the scraps of food lying about our camp.

Doves were seen by us at very great heights, especially in the Karakorúm and the Kuenlúen; and at Δ Murgái (15,448 ft.) they appeared in large numbers. This was the more surprising, as other birds were very rare in these regions.

The domestic *fowl* has recently been introduced with great success by Guláb Singh into Bálti, Ladák, and Núbra. As yet it is unknown in Gnári Khórsum.

Fishes were found by us, as by other Tibetan travellers,² in some of the small rivulets of Tibet at heights exceeding 15,000 ft. In the Alps, they exist at 7,000 ft., though apparently not beyond this limit, it having been hitherto found impossible to acclimatize them in the lakes near the St. Bernard (8,114 ft.).

Of *reptiles*,³ we found snakes and saurians, in extreme instances, as high as 15,200 ft. In the Alps they go up to 6,000 ft., in the Pyrenees to 7,000 ft.⁴ Snakes and saurians appear to reach higher in the Himálaya than Batrachians. In the Alps also lizards and salamanders have a somewhat wider range than the Alpine frog; in one extreme case the lizard "*Zootoca pyrrhogastra*" was seen on the Umbrail at 9,700 ft.⁵

¹ "Cunningham's Ladák," p. 204.

² See "Thomson's Western Himálaya," 1852, pp. 152, 165; "Cunningham's Ladák," p. 206.

³ See an interesting memoir on this subject in the "Proceedings of the Zoological Society of London, Feb. 28, 1860, by Dr. A. Günther," who kindly undertook to examine our collection of reptiles (118 specimens), amongst which he found two new genera and nine new species.

⁴ It seems rather accidental than otherwise, and as hardly consonant with the probable results of a closer investigation, that the highest locality where snakes were found on the Andes (by Mr. Castelnau) is only 7,500 ft.

⁵ Hermann and Adolphe: "Physicalische Geographie der Alpen," Vol. II., p. 606.

In the Himálaya, the number of species of snakes and frogs rapidly decreases with height, but of lizards remains nearly the same between 1,000 to 15,000 ft.

For *butterflies*, we found in the Himálaya 13,000 ft., in Western Tibet and Turkistán even 16,000 ft., as localities of permanent habitation. *Beetles* probably follow the highest formation of grassy turf in the Himálaya, as well as in the Alps. The upper limit of *mosquitoes* is at about 8,500 ft.; and *peepsies* make themselves very troublesome in the Eastern Himálaya during the rainy season as high as 13,000 ft. As in the Alps, the névé-fields of the glaciers are often covered with the remains of insects carried up by the ascending current to 18,000 and even 19,000 ft.

The existence of *infusoria* seems as little subject to limitation by height in the Himálaya, or the other chains of High Asia, as in the Alps. In a few small fragments which we chipped off from the rocks on the Íbi Gámin pass (20,459 ft.), Prof. Ehrenberg detected their presence, and even found them not insignificant in quantity; he discovered twelve species new to science. Some of these infusoria displayed a remarkable identity in external appearance with those that we had formerly collected on Monte Rosa.¹

In conclusion we add a tabular abstract selected from the materials communicated in the preceding pages, and which we have endeavoured to present in a form allowing immediate comparison.

Though we might have treated the several questions of physical geography with far greater minuteness, yet we have found it necessary to limit the present sketch to those mean results having a direct connection with our hypsometrical materials. We hope, however, at a later stage of publication, to entertain these particular branches more fully and in detail.

¹ See Hermann and Adolphe: "Physicalische Geographie der Alpen," Vol. II., pp. 233—68, and Prof. Ehrenberg's Memoir in "Abhandlungen der Academie der Wissenschaften zu Berlin," 1858, pp. 429—56.

GENERAL TABLE OF THE PRINCIPAL HYPOMETRICAL FEATURES OF INDIA AND HIGH ASIA

EXTREME HEIGHTS REACHED ON MOUNTAINS: a. *In High Asia*: The Schlagintweits 22,259 ft.; G. T. Survey erects a mark at 21,480 ft.; Dr. J. G. Gerard 20,400 ft.
b. *In the Andes*: Boussegault 19,695 ft.; Humboldt 19,286 ft.

II. ALPHABETICAL REGISTER OF THE HEIGHTS DETERMINED.

In the *arrangement* the letters follow the order of the alphabet, irrespective of the signs attached to them.

With reference to the *transcription* used, see the notes at the beginning of Part I. We allude also to the difficulty arising from a mode of transcription which in a few cases may be new to the reader. With respect to the vowels, our strict adherence to their phonetic sound will be found a sufficient guide.

To each name is added the page and the No. (Ábu, 160, 118 = p. 160 No. 118.)

Names without any designation are towns, forts, or villages. Δ denotes an uninhabited place, or a pasture ground; *H.S.* = Hill Station; *T.S.* = Tower Station.

For *Index of Materials* see pp. 546–8.

A

Abbotabad, 407, 690.	Ákra, <i>T.S.</i> , 153, 63.	Amartál, 271, 9.	Ángregi, 221, 136.
Ábu, 160, 118.	Akrakóti, <i>see</i> Karatkóti.	Ambába, 163, 18.	Antapurám, 223, 156.
Ábrang Kóma, 449, 432.	Aksáe Chin, 425, 18.	Ambála, 158, 103.	Ántri, village and pass, 162
Adam's peak, <i>see</i> Sripáda.	Áku peaks, 301, 223–4.	Ambangánga, 251, 158.	7; 201, 372.

III. ADDITIONAL REPORTS ON THE LAST JOURNEYS AND DEATH OF OUR BROTHER ADOLPHE.

- A.* MR. THORNTON'S REPORT: I. Deposition of Murád. II. Opinion of the Civil Surgeon Lahór. III. Memorandum on a note of hand. IV. Analysis of the evidence hitherto obtained.
- B.* RECOVERY OF ADOLPHE'S LAST JOURNALS: I. Lord William Hay's letter to H. and R. de Schlagintweit; II. Lord William Hay's official correspondence.
-

Our first volume contains (pp. 43—65) the official Reports that we were able to collect up to the end of 1860, about the fate of our unfortunate brother. Early in 1861, new and important evidence was brought to light, principally through the examination of Murád, a Jew from Bokhára, whom the late COLONEL IRBY, of H. M. 51st Regiment, had induced to come down to India.

At the instance of A. A. ROBERTS, Esq., the Judicial Commissioner of the Pánjáb, the examination was carried on by his personal Assistant, T. H. THORNTON, Esq., who was supported in his laborious and difficult task by COLONEL LAUGHTON and DRs. SCRIVEN and C. M. SMITH. How ably these gentlemen have acquitted themselves of their melancholy duty will become apparent from the following memoir which they have drawn up on the subject.¹

The observations of the writers are included in brackets, and printed in smaller type.

Just before the conclusion of this volume, November, 1861, we received important communications from LORD WILLIAM HAY, whom we have already repeatedly had occasion to mention in connection with Adolphe's fate. It is owing to his exertions, that we

¹ The memoir was officially printed in the "Calcutta Gazette," May 22, 1861.

are now in the possession of our late brother's manuscripts, extending as far as August 11, 1857. This is only a short time before his death,¹ which occurred on or about August 26, 1857. The manuscripts reached us January 10, 1862.

A. REPORT BY T. H. THORNTON, ESQ., PERSONAL ASSISTANT TO THE
JUDICIAL COMMISSIONER, PĀNJĀB.

As directed by the Judicial Commissioner, I have carefully examined the late Mr. Schlagintweit's servant, Murád, who accompanied Colonel Irby, of Her Majesty's 51st Regiment, from Δ Súget. I have also, as directed, reviewed in connection with Murád's statement, the evidence contained in the correspondence received from the Pānjāb Secretariat Office, and I have further made some enquiries, with a view to test the probability of the skull produced by Murád, being, as alleged, that of Adolphe Schlagintweit.

2. The result is as follows:

The account given by Murád of the death of his late master is substantially the same as that given by Abdúllah, another servant of deceased, in his deposition taken at Lahór, in May, 1859, and tallies, except in one point, with the information sent by Mohámmad Amín, the deceased's principal servant, in his letter addressed to the Commissioner of Pesháur, from Kókand, in September, 1858.

3. The evidence of Murád, thus corroborated by the statements of two other witnesses, made at different times and under different circumstances, and corroborated, also, in its main facts, by other independent testimony, was given in a manner which impressed those who heard it with its truth. There would appear, therefore, every reason for accepting it as substantially correct.

4. From a review of all the evidence in the case, it would appear that Adolphe Schlagintweit, having arrived at Δ Súget, was desirous of proceeding to Kókand, viâ Yárkand, a city within the confines of Chinese Tartary, which he was given to understand had been wrested from the Chinese by the forces of Kókand. He would seem to have been well aware of the perilous nature of his journey, for in a promissory

¹ See p. 536. We have to consider as a new proof of the general sympathy felt for the lamentable fate of our brother Adolphe, that the English as well as the Continental press did not fail at once to make known the recovery of his journals and to draw attention to their importance.

note given to his servant Murád, just before setting out, he alludes to the possibility of his never reaching Kókand alive, and he further took the precaution of dispatching his khánsamah, with his papers and heavy baggage, to Ladák, which have been duly received, and forwarded to Germany.

5. On arrival at Yárkand, he found that a border warfare was going on between a band of Kokándis, under one Dil Khan, or Zúllah Khan, one of a race of Sáýad chieftains, who under the guise of religion make periodical raids into the Chinese territory. He was well received by this chieftain, but the state of affairs, or according to Abdúllah and Murád, the most minute of the narrators, a successful attack of the Chinese, upon the camp of Zúllah Khan, led Mr. Schlagintweit to proceed to Káshgar, which was then in possession of another more powerful Sáýad chieftain by name Váli Khan, and honoured with the title of Pir, or Saint, who had for a time wrested it from the Chinese.

6. He proceeded—apparently without suspicion—to the court of this chieftain; and sent his servant Mohámmad Amín, to announce his arrival, and meanwhile pitched his tent close by. Shortly after Mohámmad Amín's return, a person came over from the chief's camp, and commenced making an inventory of deceased's goods, and according to Abdúllah demanded his arms, which were given up. Adolphe Schlagintweit upon this went, or was forced to go, into the chief's camp, and would appear to have remonstrated against what was being done; on which he was summarily beheaded, and his servants seized. Abdúllah was sold as a slave, and eventually found his way to Pesháur. Mohámmad Amín was shortly afterwards released and went to Kókand, where he is now. Murád, the Jew, saved himself from death by turning Mussálmán, and was also released about a month afterwards on the Chinese re-capturing Káshgar.

7. There appear no adequate reasons to warrant the imputation of treachery against any of the deceased's servants. The rumours to that effect said to be current among Yarkándi merchants, and on the Kashmír border, may, I think, be explained by the tendency which all Asiatics have to presume treachery, as a matter of course, in such cases, and by the known hostility of the Kashmír authorities to Mohámmad Amín. As far as can be judged from the evidence, the deed appears to have been the sudden act of a fanatical marauding chief.

8. With regard to the skull produced by Murád as that of the deceased, it would appear from a consideration of the circumstances under which it was obtained, the

report of Dr. Smith, Civil Surgeon, of Lahór, who, in company with Dr. Scriven, Principal of the Lahór Medical College, made a careful examination of it, and lastly the opinion of some who have seen the deceased, there can be little doubt that the skull is *not* that of Mr. Schlagintweit.

9. From Murád's statement it would appear that he did not obtain the head for upwards of ten months after the deceased's death; he cannot say whether the person from whom he obtained it found it himself; it was found among a number of other heads of persons killed in a fight which must have taken place about a month after Mr. Schlagintweit's death; hence, *a priori*, the chances against its being Mr. Schlagintweit's skull are very great; besides, from Dr. Smith's report it would appear that there are indications that the skull belonged to a man who had his head shaved: whereas Murád expressly states that the deceased, though he wore his hair short at the time, certainly had not his head shaved. The teeth, moreover, are apparently those of a man of greater age than the deceased, and are so peculiar that they must have formed a prominent feature. Yet, none of those who remember the deceased, with whom I have communicated, recollect any such peculiarity. Lastly, the hair on the skull is stated by Dr. Smith to be of the colour of that of natives of the country, whereas Mr. Schlagintweit's hair is said to have been lighter.

10. With reference to the above is annexed:

- I. A copy of Murád's deposition (with notes).
- II. An examination of a skull by Dr. Smith, Civil Surgeon at Lahór, assisted by Dr. Scriven.
- III. Memorandum on a Note of Hand purporting to be that of the late Mr. Schlagintweit.
- IV. An analysis of the evidence in the case.

11. With regard to the deceased's property, there can be no doubt that the book and case containing a mathematical instrument belonged to him; it appears, however, according to Murád's evidence, and the statement of the man Áhmad, that there is some more property of the late Mr. Schlagintweit in the possession of some persons at Sánchu, in the Yárkand territory. Colonel Irby, it appears, urged the thanadár at Leh to use his exertions to recover this property, but the thanadár's exertions would probably be stimulated, if the Kashmír authorities (his superiors) were addressed upon the subject.

12. Another point arises in connection with this enquiry, on which some remarks appear necessary; I mean the claim which Murád, should he be considered free from suspicion, has upon the Government. He holds a promissory note for rupis 3,600, in the hand-writing of deceased, dated 3rd July, 1857, on account of 300 "seklow, or white fur skins." This amount, the writer of the note requests, may, in the event of his death, be paid from the Kángra Treasury. From the note it would appear that the greater portion of these goods was made over to the missionaries of Lahól for sale, but it does not appear what has become of them. I have addressed a letter to the missionaries at Lahól, but as the matter does not affect the main object of this enquiry, I have not delayed this report until the receipt of a reply.

13. In addition to his claim for rupis 3,600 upon this promissory note, he would appear to deserve, should he be considered free from the imputations of treachery, some compensation for the trouble of coming down to Lahór, and losing his avocation as silk merchant; and further for the hardships he has undergone in consequence of his faithful service to the deceased. I may mention that Colonel Irby has advanced him rupis 50 towards the expenses of his journey, and has stood security to the amount of rupis 198 for debts due by Murád to one Bála Sáhib, a merchant of Leh; consequently, out of any sum awarded to Murád, rupis 248 should be made over to that officer.¹

I. DEPOSITION OF MURÁD, A JEW, NATIVE OF BOKHÁRA, BUT SETTLER IN KÁSHGAR, BY
PROFESSION A SILK MANUFACTURER.

Mr. Schlagintweit engaged me in Kúlu, four years ago, to go with him to Kókand, together with Mohámmad Amín of Yárkand (who introduced me to the Sáhib), Abdúllah, a Kashmíri, and four other servants, one of them a múnshi; but I do not know their names.

[The múnshi must have been Mohámmad Hássan, who afterwards abandoned Mr. Schlagintweit on the march, as detailed in Abdúllah's statement].

We started in the early spring from Kúlu and arrived eventually at Δ Súget. One march from Δ Súget, all Mr. Schlagintweit's horses were stolen. Mohámmad Amín and myself went to look for the horses and recovered eleven. I went on to Kílian, the first village in Chinese Territory, and there met some Badakhshánis, who told me

¹ By order of the Government, Murád was paid the amount of the promissory note (3,600 rupis), and received a reward of 200 rupis. The sums advanced by Colonel Irby to Murád, were repaid to this officer.

that Yárkand was in a state of anarchy. I, therefore, returned and advised the Sáhib not to go there. Some twenty days afterwards, other merchants came from Yárkand, and informed us, that Váli Khan had conquered Yárkand and Káshgar. So the Sáhib went on from Δ Súget to Kílian, where he gave me a letter addressed to one of Váli Khan's adherents, in Kárgalik, by name Háji, who almost immediately discovered the thieves, and produced the stolen property, and sent a fine Turki horse as a present to the Sáhib.

[The truth of this statement is corroborated in a remarkable way by the statement of one Káttah Áli Shah, who was at Kárgalik at the time, made to Mr. Knox in October, 1858. He mentions that the thieves came and offered some suspicious property for sale in Kárgalik, and that the fact was reported to Háji Misser, the Kardár. That the property turned out to be that of a Sáhib, &c. This explains how the Háji was enabled to produce the thieves and stolen property so quickly.]

The Sáhib staid three days in Kárgalik, and treated the Háji for a sabre wound which he had received in a quarrel. The Háji was very grateful for this, and wished to put the thieves to death, but the Sáhib persuaded him not to do so.

[This circumstance may have given rise to the rumour that Mr. Schlagintweit was executed for interceding for some captives.]

From Kárgalik we went to Yárkand, where we found fighting was going on between Tíla Khan (called by Abdúllah "Dil, or Zúllah Khan") and the Yarkándis. The Khan was a Lieutenant of Váli Khan at Káshgar. Tíla Khan received the Sáhib kindly. I was not present at the interview, having remained with the tents about half a *koss* off, but I heard from Mohámmad Amín that the Sáhib presented Tíla Khan with a telescope, a sword, and other articles. Tíla Khan was much pleased, and asked the Sáhib whether he thought the Chinese could take his position—the Sáhib replied that he was not a soldier, but merely came for a peaceful interview. About two hours after the interview, the Chinese forces attacked Tíla Khan, and drove him away, and the Sáhib retreated too, and proceeded to Káshgar, which is six days' journey from Yárkand, to join the camp of Váli Khan, who, he heard, was supreme in those parts. One march from Káshgar, Mr. Schlagintweit sent Mohámmad Amín with some shawls and silk as presents to Váli Khan. The next day Mr. Schlagintweit encamped by the camp of Váli Khan, about a *koss* from the town, Mohámmad Amín here returned, and was followed shortly afterwards by a múnshi, sent by Váli Khan, who proceeded to take a list of the property which was contained in four boxes,

two large and two small. I do not know whether the Sáhíb objected to this proceeding, as I was with the horses, but he shortly afterwards proceeded to Váli Khan's camp, accompanied by Mohámmad Amín and Abdúllah, and another servant, a Tibetan, whose name I do not recollect.

[This accounts for the fact that Abdúllah's report of deceased's death is more minute than that of Murád.]

Just at this moment, one of the Sáhíb's horses got loose; it was the horse the Háji had given him, and I went, by the Sáhíb's order, to secure it. A few minutes afterwards I heard a disturbance, and was myself seized by three men, who tied my hands. I looked towards Váli Khan's camp, and saw the Sáhíb lying with his head cut off. Mohámmad Amín, Abdúllah, and the Tibetan servant were also seized, and taken with me into Káshgar. I do not know why the Sáhíb was killed, but I heard at the time that it was because he refused to pay duty upon his goods. I remained in Káshgar a prisoner about a month. Abdúllah was shortly afterwards sent for by the Khója Váli Khan, and did not return; the Tibetan servant was put to death. I was threatened with death unless I turned Mussálmán, which I did. After about a month, the Chinese drove out Váli Khan from Káshgar. On this occasion Mohámmad Amín made his escape and went to Kókand, in order to complain to Khudayár Khan, Khan of Kókand, of the treatment they had received from Váli Khan. I was released by the Chinese, and remained in Káshgar, where I carried on my trade of silk manufacture.

About ten months after this event, I heard that a certain barber, whose name I forget, had in his possession the skull of Mr. Schlagintweit. I went to him and recognized the skull as Mr. Schlagintweit's, by the peculiarity of the teeth. I cannot say whether the barber found the skull himself, but he told me he found it among a number of bodies of men who had been killed in an engagement which took place about a month after Mr. Schlagintweit's death, and it was his custom, after a fight had taken place, to attest the skulls of those killed and dispose of them to their friends. I gave the sum of twelve tilas (72 rupis) for the skull.

CROSS-EXAMINATION.

Mohámmad Amín never made over the remains of Mr. Schlagintweit to me.

Mr. Schlagintweit did not shave his head, or attempt to conceal that he was an European; he had light hair.

[Dr. Smith states that the skull produced is the skull of a person who habitually shaved his head.]

The book and case, I now produce, were portions of the deceased's property. I bought them from a person in Káshgar.

[The book is a German work on Geography entitled — "Die Erdkunde im Verhältniss zur Natur und Geschichte des Menschen;" it bears no name.¹ The case contains a mathematical instrument, apparently a kind of protractor.]

I have no other property of the deceased; but about two months before his death, he left some property at Sáýad-Úlla Khója, with three men of Sánchu in Yárkand, named Máksun, Shámur, and Míssa.

[This property was seen by Áhmad Árgon, who was sent to enquire after deceased's effects and death at the end of 1858, and the possessor offered to give it up for seven battis of opium.]

While I was in Káshgar I made numerous enquiries and wrote to persons in Andishán, Kókand, and Margilón, but could get no trace of other property. The promissory note I produce was given me by Mr. Schlagintweit at Δ Súget, just before we started from that place. He gave it to me because I was very anxious about some "Sagábi" (beaver, or other skins) which I had brought up with me from Déhli, but had been forced to leave behind. The Sáhib, therefore, to make me easy, agreed to take them off my hands. The following is a copy of this note:—

"This is to certify that I owe to pay the bearer Murad, Jehoodée from Bokhara, for 300 Saklows, or White Fur Skins, on account of Government, the sum of gold Tillas of Kokand (being about 6 Rupees each) 600, six hundred Tillas, the Seklows, which could not be carried along with me, having been made over to me in Lahoul for sale at Ladakh. (The profits of this sale, confided by me to the care of the Reverend Missionaries stationed at Lahoul, will be made over to Government hereafter.) I pledged myself to pay the bearer the price of the Seklows as it is in Yarkund, &c. The money to be paid by me at my arrival in Kokand, or in the case of my death, by the Kangra Treasury."

ADOLPHE SCHLAGINTWEIT,

In charge Magnetic Survey of India.

Camp Suget; Karakorum road, the 3rd July, 1857.

¹ It is "Ritter's Erdkunde," a book so full of general information, that we constantly carried it with us during our travels.

I did not go to Kángra with this bill after my release because it was currently reported that the British rule in India had been overthrown. About a year afterwards I sent information to Tári Chand in the British territory. [This is true.] But I could not come myself, because I was in debt.

Mohámmad Amín is still, I believe, in Kókand, and is willing, I believe, to come in, if sent for. I have heard that Mohámmad Amín petitioned Khudayár Khan, the Khan of Kókand, that his master had bought a large amount of valuables and telescopes for a present to the Khan, but that Váli Khan had robbed him of them and killed the Sáhib. In consequence, the Khan of Kókand summoned Váli Khan, who denied the charge; the Khan imprisoned him, but as he was a Sáýad he was afraid to do any thing more, and released him.

I have never heard that Mohámmad Amín is living in great wealth. He was a wealthy man once, but I have every reason to believe that he has, like myself, been living in poverty, and that both he and I have been ruined in the ruin of our master.

I make no claim upon the Government, except the payment of the note of hand, and any thing more it may be pleased to give me.

I have heard of the name "Búzruk Khan." He is a Sáýad chief, like Váli Khan; he had nothing to do with the death of Mr. Schlagintweit, but was at Kókand at the time.

[This explains the origin of the account obtained by the Russian authorities, *viz.* that the deceased was killed by one Búzruk Khan. The fact that the murder was effected by a Sáýad chief will easily account for its being currently fixed by report upon Búzruk Khan, who answered to the description of Sáýad Chief, and whose character probably justified the imputation.]

Murád's deposition was originally taken, as directed, in the presence of Colonel Irby, but I examined him subsequently on several occasions upon points which occurred to require elucidation. His deposition, given above, differs in some points from the account given by Colonel Irby in his letter to Government, but I have questioned him closely upon the points where his present statement differs from that given in Colonel Irby's letter, and I am disposed to think that the present is a correct record of his evidence. Colonel Irby mentioned to me that it was probable that in some cases Murád's meaning had been misrepresented to him.

II. OPINION OF THE CIVIL SURGEON, LAHÓR, DATED 23RD NOVEMBER, 1860.

"After very carefully examining the skull you sent me, I have come to the conclusion that it is *not* that of an *European*, and, certainly not that of the late

Mr. Schlagintweit; and I form my opinion from the following circumstances:—The scalp is that of a man who was in the habit of having his head shaved. The hairs that remain are short and bristly, and of a black colour, resembling that of a native of this country. The teeth are worn in a peculiar manner, and indicate an age of between thirty and forty years, which is, I believe, considerably older than the late Mr. Schlagintweit was at the time of his death.

The configuration of the skull is not typical of European origin.

It is evident that the man was decapitated, as part of the mastoid forcep on the right side is sliced off, as well as the first vertebræ being cut in two, and there is also a mark of a talvár cut on the occiput."

III. MEMORANDUM ON A NOTE OF HAND PURPORTING TO BE THAT OF THE LATE ADOLPHE SCHLAGINTWEIT, FORWARDED WITH COLONEL LAUGHTON'S LETTER DATED JANUARY 2, 1861.

From a comparison of the hand-writing of this "note of hand" with the hand-writing of that produced by Murád, and specimens of deceased's hand-writing existing in the Secretariat Records, there can be no doubt that this note of hand was written by Adolphe Schlagintweit.

I have examined Murád, the Jew, respecting the circumstance of this loan. He informs me that Dáda Boy, from Margilón, kept a shop in Yang Hissar, a town in the Chinese territory, between Yárkand and Káshgar, and about two marches from the latter place. That Adolphe Schlagintweit, on his retreat from Yárkand, passed through Yang Hissar, *en route* to Káshgar. There, being in want of money, he applied to Dáda Boy, with whom Murád had some acquaintance, for an advance. On Murád's recommendation, Dáda Boy advanced Mr. Schlagintweit four hundred tángras, in lieu of which Mr. Schlagintweit promised to pay 12 tílas, and gave a note of hand for the amount.¹ (In the note of hand only 10 tílas are mentioned.)

That the value of the tíla in that place is about 7 rupis. (In the note of hand given to Murád, Mr. Schlagintweit values the tíla of Kókand at 6 rupis.²) He adds

¹ By order of the Government, 140 rupis have been paid for this "note of hand," a sum equal to double that mentioned by Adolphe.

² In the summer of 1856, when we (H. and R. de S.) were in Turkistán, the tíla, a very fine gold coin, was valued at 6 rupis.

that this took place about six or seven days only before deceased's death. The note of hand¹ is dated August 19, 1857. Hence, we are now enabled to fix, within a day or two, the date of Mr. Schlagintweit's death, which must have taken place

on or about the 26th August, 1857.

I take this opportunity of stating that I have observed in the *Hurkaru* newspaper a copy of a statement made by one Khunj Khan to Mr. Johnson, Civil Assistant of the Great Trigonometrical Survey of India, regarding the circumstances of Mr. Schlagintweit's death. His statement corroborates the opinion I have expressed as to the complicity of the servants of deceased in their master's death. His account tallies generally with that given by Murád, but differs in the following points:—First, he states that the Kokándis before Yárkand were commanded by Váli Khan, whereas, according to Murád's account, confirmed by other accounts, they were commanded by one Zúllah, or Dil Khan.

In the second place, he states that Mr. Schlagintweit was not put to death until the day after he was taken prisoner by Váli Khan. Of these discrepancies I would remark that Khunj Khan does not expressly state that he was an eye-witness of what he relates. Murád, whom I have examined on the point, expressly denies that he was present, but affirms that Khunj Khan was employed by Mohámmad Amín as a servant after the event, and hence obtained his information.

If Khunj Khan obtained his evidence by hearsay, these discrepancies may be easily accounted for.

IV. ANALYSIS OF THE EVIDENCE HITHERTO OBTAINED REGARDING THE DEATH OF MR. SCHLAGINTWEIT.

The following is the evidence obtained regarding the circumstances of the death of Adolphe Schlagintweit. We have:

First.—The personal evidence of three professing eye-witnesses, persons known to have been deceased's servants, *viz.* that of Abdúllah, Mohámmad Amín, and Murád.

Secondly.—The *hearsay evidence* of the following:—

1. Of Máni, who obtained most of his information from one Núrpur, who was at Yárkand during the time.

2. Of Káttah Áli Shah, who was at Kárgalik and saw deceased there in July, 1857.

¹ It is to be borne in mind, that this "note of hand" is quite independent of the "promissory note" mentioned p. 533.

3. Of the leader of a caravan (obtained via Russia.)
4. Of one Mándas, who heard what he states from Hári Chand (through Tári Chand), Thákur of Gúndla, a village in Lahól.
5. The report of Hári Chand (November, 1859).
6. Report of Áhmad, &c.

The evidence of the three personal attendants was obtained under the following circumstances:—That of Mohámmad Amín is contained in a letter addressed to the Commissioner of Pesháur from Kókand, dated July 29, 1858. That of Abdúllah was given at Pesháur in December, 1858, and subsequently at greater length at Lahór, in May, 1859. That of Murád has just been recorded. The evidence of these three eye-witnesses, taken under different circumstances and at different times, tallies so completely on all important points, that it would be almost waste of time to examine other evidence, were it not that of late it has been hinted that Mohámmad Amín and probably Murád were implicated in the murder of their master, by betraying him into the hands of the chief who put him to death. It will be seen, however, that not only does the evidence of these three eye-witnesses tally, but that their evidence is corroborated, in the main points, by hearsay evidence, some of which is traceable to the vicinity of the locality where the tragedy occurred, and in some collateral points by the independent testimony of having personal knowledge of the facts to which they depose. Having first, therefore, endeavoured to show the trustworthiness and reliability of the account given by the deceased's personal servants, from a comparison of those accounts with other independent testimony, I shall proceed to examine into the charges brought against Mohámmad Amín and Murád, of complicity in the deceased's death.

The agreement in the several reports of Mohámmad Amín, Abdúllah, and Murád, may be seen at once by reading their accounts side by side.

MOHÁMMAD AMÍN.	ABDÚLLAH.	MURÁD.
Mr. Schlagintweit went to Yárkand against his (Mohámmad Amín's) advice. (Mohámmad Amín does not allude to the robbery of Mr. Schlagintweit's horses.)	Mohámmad Amín dissuaded Mr. Schlagintweit from going to Yárkand. Mr. Schlagintweit's horses stolen shortly after starting for Yárkand.	One march from Δ Súget, all Mr. Schlagintweit's horses were stolen.
	Mohámmad Amín and the Jew servant (Murád) sent in quest of the horses and recovered seven.	Mohámmad Amín and myself went to look for the horses and recovered eleven.

MOHÁMMAD AMÍN.	ABDÚLLAH.	MURÁD.
Murád sent to report upon the state of things in Yárkand.	At Shúmla Khója, Mohámmad Amín dispatched his servant Murád to bring information of the war going on there.	I went on to Kílian and have met some Badakhshánis, who told me that Yárkand was in a state of anarchy. I therefore returned and advised the Sáhib not to go there.
Murád returned and reported that the Khan of Kókand had wrested from the Chinese the provinces of Káshgar and Yárkand.	Murád reported that the Khan of Kókand was making war upon the Chinese.	Some twenty days afterwards, merchants came from Yárkand and informed us that Váli Khan had conquered Káshgar and Yárkand, so the Sáhib went on to Kílian.
Mr. Schlagintweit proceeds to Yárkand. The inhabitants of Yárkand treat Mr. Schlagintweit with courtesy, and Mr. Schlagintweit gave the chief men presents.	On this report, and on the assurance of certain merchants, Mr. Schlagintweit was induced to proceed. Mr. Schlagintweit proceeded to Kárgalik (it is strange that neither Mohámmad Amín nor Abdúllah allude to the interview with Háji Mísser) and thence to Yárkand. When Mr. Schlagintweit reached within three <i>koss</i> of Yárkand, Zúllah Khan, who was warring with the Chinese, came to Mr. Schlagintweit himself and brought him bread and tea.	Murád sent on from Kílian to Kárgalik; interview with the Háji. Went to Yárkand, where we found Zúllah Khan fighting with the Yarkúndis. Zúllah Khan received the Sáhib kindly; also made handsome presents to the chief.
From thence proceeded to Káshgar, which was then occupied by a Khója of Kókand.	In the mean time some 40,000 or 50,000 Chinese troops opened out of the City and attacked Zúllah Khan.	About two hours after the interview, the Chinese forces attacked Zúllah Khan and drove him away.
The Chinese forces were encamped outside the town, and laid siege to a fort called Gul Bagh, situated about a mile outside the town.	Zúllah Khan gave Mr. Schlagintweit a passport to Káshgar. Mr. Schlagintweit accordingly proceeded thither and found Zúllah Khan fighting outside the town in co-operation with Váli Khan, who had taken possession of the town a short time previously.	The Sáhib retreated too, and proceeded to Káshgar to join the camp of Váli Khan, who was supreme in those parts.
	[This appears strange, but it is possible that Zúllah Khan stole a march upon Mr. Schlagintweit, arrived at Káshgar before him, and was co-operating with Váli Khan when he arrived.]	

MOHÁMMAD AMÍN.	ABDÚLLAH.	MURÁD.
The fight was going on when we arrived. The Mussálmáns asked who we were.—Mr. Schlagintweit replied that he was the Hon'ble East India Company's Envoy, and was going to the Khan of Kókand.	Mr. Schlagintweit sent word to Váli Khan that he desired to see him. He ordered him to wait in a tent. Half an hour afterwards a múnshi of his came and demanded arms from Mr. Schlagintweit, which were given up. His sipáhis came afterwards and seized me. Mr. Schlagintweit expostulated, so they seized him.	Mr. Schlagintweit sent Mohámmad Amín with presents to Váli Khan, and the next day encamped by him.
Upon this they got in a rage and ordered Mr. Schlagintweit to be beheaded.	They carried him about three hundred paces, stripped him, and cut off his head with a sword.	Mohámmad Amín here returned, and was followed shortly by a múnshi, sent by Váli Khan, who proceeded to take a list of the property.
I with my followers were thrown into prison and plundered of all our property.	They took me captive to Káshgar. There I was sold away to a party who sold me to another till I reached Pesháur.	Mr. Schlagintweit went to Váli Khan's camp with Mohámmad Amín and Abdúllah. Shortly after, Murád found himself seized and saw the body of his master, who had been beheaded.
In thirty-five days of our confinement my two servants died, and the third was missing.	[He was sold as a slave for 25 rupis to a man called Tázak; a Sáiyad of Pesháur, by name Míán Khalíl, procured his freedom, by paying to Tázak 25 rupis.]	Mohámmad Amín, Abdúllah, and the Tibetan, were also seized and taken with me into Káshgar.
Meanwhile the Khatáís (Chinese) having been reinforced, overpowered the Khója and obliged him to fly. I, consequently, got my release, and went to Kókand.		Abdúllah was shortly afterwards sent for by the Khója Váli Khan, and did not return. After about a month, the Chinese drove out Váli Khan from Káshgar. Mohámmad Amín escaped to Kókand, and I was released.
Placed the remains of Mr. Schlagintweit in charge of Murád.		Found Mr. Schlagintweit's skull in the possession of a barber, ten months after this event.

It will be seen from a perusal of the above, that the accounts of each corroborate and confirm each other in material points, while some are fuller in details than the other, on points which appear to have come more particularly under their observation. Murád, it appears, is very minute in his account of the mode by which Mr. Schlagintweit's stolen property was recovered. This is explained by the fact that he was, according to the testimony of Abdúllah, sent on a special mission, during which he managed to effect the recovery of the stolen property.

Again, Murád is less minute than either Mohámmad Amín or Abdúllah in detailing the circumstances of Mr. Schlagintweit's death, but he quite incidentally accounts for this by saying that Mohámmad Amín and Abdúllah accompanied Mr. Schlagintweit to the camp of Váli Khan, where deceased was beheaded, while he was engaged in catching a stray horse.

It is true, Mohámmad Amín omits one or two important incidents mentioned by the two others, as the robbery of Mr. Schlagintweit's horses, and he does not allude to Zúllah Khan, or to Mr. Schlagintweit's flight from Yárkand, but it must be remembered that Mohámmad Amín's evidence is contained in a letter, and is not the result of a searching examination.

The only discrepancy of any importance is that relating to the remains of Mr. Schlagintweit. Mohámmad Amín states he placed them with Murád: Murád denies this, and states that he did not find them till ten months afterwards. On this point, however, Mohámmad Amín has not been questioned, and it is very likely to be nothing more than a loose statement, prompted by a desire to show his devotion to his master.

I now proceed to notice how far these reports are corroborated by other testimony.

Káttah Áli Shah, in his deposition taken by Mr. Knox in September, 1858, mentions from personal knowledge the interview of Mr. Schlagintweit with the Háji at Kárgalik, though he differs in his details from Murád. He alludes to Mr. Schlagintweit going to Zúllah Khan's camp; to the battle which ensued, the defeat of Zúllah Khan, and Mr. Schlagintweit's retreat. Mání (January, 1859) states that he heard from a person who was at Yárkand at the time of the arrival of Mr. Schlagintweit in these parts, while war was going on between the Chinese and Yarkándis, of his being first well received by the former, and accompanying them to Káshgar, where he was put to death by them.

In the report furnished by the Rájah of Bissér, Mr. Schlagintweit is represented as proceeding from Yárkand to the camp of "Bul Khan," who put him to death at Káshgar.

The reports of Hári Chand and Ahmad, who were despatched at the close of 1858 to make enquiries, are not before me in full, but they would appear to agree in the principal facts.

The chief points in which these hearsay reports differ from those of the eye-witnesses are in confounding Dil Khan, or Vállah Khan, and Váli Khan, who are different persons, and in accounting for the immediate cause of deceased's death, in regard to which, as might be expected, each hearsay account has a new story.

It may be asserted, therefore, with confidence, that the account we now possess of the circumstances of deceased's death, derived from the statements of his servants, is substantially correct.

Mr. Thornton concludes his interesting report on the fate of Adolphe by a detailed examination into the charge made against Mohámmad Amín and Murád of complicity in our brother's death. Murád, though personally known to us, was never in our service. Mr. Thornton says about him: "I cannot but express my conviction of his entire innocence; he is entitled to credit and reward."—With reference to Mohámmad Amín, we have already stated (Vol. I, p. 39), "that, as far as we are able to judge, no blame whatever can be attached to him in connection with the murder of our brother."

Mr. Thornton has also arrived at this conclusion.

B. RECOVERY OF ADOLPHE'S LAST JOURNALS.

I. LORD WILLIAM HAY'S LETTER TO H. AND R. DE SCHLAGINTWEIT.

Srinágger, Kashmír, Sept. 9, 1861.

You will be glad to learn, that I have at this moment in my possession your brother Adolphe's note-book, with 135 pages closely written notes in it.—Then also a skull alleged to be his. I attained the things in this way:

When at Leh, a Persian, named Mírza Ábdul Vadád, came to me and stated, that in a caravan shortly expected at Leh, there was a parcel for him containing your brother's skull and his note-book. He said that he had no money, that consequently the caravan people would not give up the parcel. I sent a Tartar servant of mine with the Mírza on the road to Yárkand with instructions to get a hold of the parcel and bring it me as quickly as possible. About seven marches from Leh they met the caravan. The man in charge of it at first refused to give up the parcel,

demanding 200 rupis for its carriage. Eventually they were induced to give it up on my servant giving them six gold mohurs—all he had with him.

Last night, he and the Mírza reached Srinágger.

The note-book was purchased by the Mírza from a man of Káshgar, named Kārím Khan, into whose possession it seems to have come quite accidentally.

The journal extends from June to August 11, 1857.

With respect to the circumstances attending his death, the Mírza's account entirely corroborates the accounts given by the Kashmíri Abdúllah¹ and Mohámmad Amín.² The Mírza states, that your brother was beheaded by order of Váli Khan, that the head was hung up over a bridge, and removed then to a tree, that a person of the country, some months after, who happened to be growing melons under, or at least near the tree, buried the head in the ground. This man pointed out the spot to the Mírza; who dug up the ground and found the skull.

I am naturally sceptical with respect to the identity of the skull, the more so after the former attempt made to palm off a skull as that of your poor brother, which, however, proved to be that of a native.

The Mírza, who is certainly a very respectable, and, as far as I can judge, a trustworthy man, declares his conviction, that the skull is that of your brother. He says the melon-grower at once pointed out the spot where it was, and neither asked nor received any reward for so doing.

II. LORD WILLIAM HAY'S OFFICIAL CORRESPONDENCE.

From
LORD WILLIAM HAY
to
THE SECRETARY TO THE GOVERNMENT OF THE PANJÁB.

DATED SEPT. 14, 1861.

I have the honour to report, for the information of His Honour the Lieutenant-Governor, that I have at this moment in my possession the Journal of Mr. Adolphe Schlagintweit, who, His Honour doubtless recollects, was so cruelly murdered at Káshgar, in 1857. I have also what is alleged to be his skull.

2. On my arrival at Leh, in August last, one Mírza Ábdul Vadád, a man of Herat, presented himself at my tent, and stated that in a caravan expected shortly at Leh from Yárkand there was a parcel to his address, containing a manuscript book which belonged to the gentleman who was put to death at Káshgar, as well as what he fully believed to be his skull. The Mírza represented himself to be entirely without funds and despaired of ever recovering the parcel from the men in charge of the caravan.

I lost no time in despatching the Mírza with a Tartar servant of mine towards Yárkand, with instructions to recover the parcel, paying for its carriage, and to follow me with as much speed as possible to Srinágger.

3. About seven marches from Leh they met the caravan. The persons in charge at first positively declined to give up the parcel, they then demanded 200 rupis, eventually they agreed to take six gold mohurs, worth 17 rupis each, all the money my servants had with them. The Mírza and servant at once started for Srinágger, which they reached with the precious parcel a few days after myself.

4. The Mírza's account of himself is that he left Herat about five years ago in consequence of the disturbed state of the town, and has been wandering ever since in the countries between Afghanistán and Yárkand, in the guise of a hakim, or physician. At Bokhára he heard of the death of Mr. Schlagintweit. Aware of the

value which would be attached by us to any books, papers, &c., belonging to the unfortunate traveller, the Mírza on his arrival at Káshgar, set diligently to work to search for his property. For a long time he was unsuccessful, but about sixteen months ago he contrived to procure, through one Kārím Khan, son of a Múlla or priest of Káshgar, a manuscript book, which a dealer in snuff had bought for the sake of the paper, which he used in packing small quantities of snuff. Something less than one rupi was paid for the book.

Not long after, a cultivator informed the Mírza that after Mr. Schlagintweit was put to death his head was first suspended over a bridge and then placed in a tree under which he happened to grow melons, and that he buried it in his field. The Mírza dug up the ground, which was then covered with snow, at the spot indicated, and found a skull of the murdered man; but I am not very sanguine in the matter, and shall not be certain as to its genuineness till I have submitted it to a competent judge. The book contains 135 pages of closely written notes in the German language, and is Mr. Schlagintweit's Journal¹ from the 14th of June to the 11th of August, 1857, the day he started from Kárgalik, a village about fourteen miles on the Ladák side of Yárkand.

5. With regard to the manner of his death, the Mírza's account agrees in every material point with that given by Kashmíri Abdúllah, and published in Messrs. H. and R. de Schlagintweit's printed circular.

On arriving near the city of Yárkand, Mr. Schlagintweit found it closely besieged by a robber chief, or "crescentader", of Kókand, named Dilla Khan. By this man Mr. Schlagintweit was made a prisoner. Almost immediately after, Dilla Khan was compelled by the Chinese to fall back on Káshgar, also a Chinese town, but which had been occupied by another "crescentader" of Kókand, named Khója Váli Khan. Mr. Schlagintweit continued a prisoner in the hands of Dilla Khan and was brought to Káshgar. On reaching a spot not more than 200 yards from the tents of the Khója Váli Khan, one of Mr. Schlagintweit's guard went to inquire of him what was to be done with the "Feringi." The Khója, who is described to be a man of infamous character, at once ordered his execution. The persons entrusted with this work endeavoured to bind Mr. Schlagintweit's arms, but this indignity he successfully resisted; a blow was then struck with a sword, which took effect under his right ear,

¹ It reached us safely and in excellent condition, January 10, 1862.

another was aimed at the left side of his head, but neither proving fatal, his throat was cut with a knife, which one of the executioners drew from his side. The head was then severed from the body and hung up over a bridge.

The Khója was soon after driven out of Káshgar by the Chinese, and is now wandering about a miserable drunkard without a single follower.

6. With reference to the above narrative, I think it right to mention that it does differ in one or two points from the account given by intelligent persons at the time residing in Yárkand. *There* the story is, that Mr. Schlagintweit made friends with Khója Dilla Khan and offered to direct his operations against Yárkand, that he was forced to fly with the defeated Khója, and that he was put to death by Khója Váli Khan, for sitting before him in a disrespectful attitude, that is, with the soles of his feet turned towards the Khója. My informant, the Mírza, however, states that Mr. Schlagintweit was never in the presence of Khója Váli Khan, while with regard to his directing the operations against Yárkand, it is possible that he may have offered to assist Dilla Khan, but certainly not till he was taken prisoner and saw that his life was in danger.

7. With respect to the chances of recovering any other articles, the property of Mr. Schlagintweit, I am of opinion that little or no hope can reasonably be entertained of any further success. The Mírza informs me that he left no stone unturned in his search at Káshgar, but never succeeded in obtaining the trace even of anything besides the book; this is, however, the less to be regretted, if it should prove true that Mr. Schlagintweit sent all his Journals up to the 14th June to Kángra.¹

8. In conclusion, I have only to express a warm hope that Mírza Ábdul Vadád will not be left unrewarded.

Besides defraying the Mírza's expenses from Leh to Kashmír, I have made him an allowance of a rupi a day from my private purse. He accompanies me to Símla.

¹ We are unable positively to state, whether Adolphe has sent his journals to Kángra, or not; the fact, however, is, that within the last year we have received the greatest part of his journals, some of which extend as far as June 14, 1857. Also a considerable number of his drawings and collections has mean time reached us; some of the former seem to have been the contents of the two parcels which Adolphe sent to Kángra from Changchénuo on or about June 14, 1857. We particularly wish to make this statement, as Lord Hay, more anxious, than happily at present the circumstances require, added to his official letter the remark, that, "no inquiry appears to have been made respecting the fate of these parcels. This is unfortunate; even now it is not too late."

To his exertions we owe the rescue from destruction of a valuable manuscript, rendered doubly valuable by the tragic death of its writer, one of the boldest, most enterprising, and accomplished travellers of modern times. •

I avail myself of this opportunity to state, with reference to a repeated assertion to the contrary which appears in the printed reports relating to Mr. Schlagintweit's death, that I never to my knowledge saw Mohámmad Amín, and certainly never recommended him to Mr. A. Schlagintweit. I believe that he was a most useful and faithful servant.

From
THE SECRETARY TO THE GOVERNMENT OF THE PĀNJĀB
to
LORD WILLIAM HAY, DEPUTY COMMISSIONER OF SÍMLA.

DATED SEPT. 21, 1861

I am directed to acknowledge your letter of the 14th instant, and to convey the thanks of the Hon'ble the Lieutenant-Governor for your exertions in procuring the Manuscript Journal of the late Mr. A. Schlagintweit.

2. His Honour authorizes a reward of 500 rupis being given to the Mírza on his arriving at Símula, in addition to his expenses being paid from the time he joined you at Leh, and sanctions the money advanced to the Mírza, being reimbursed to yourself. You are requested to submit a bill for the whole amount for the counter-signature of this Office.

3. I am to add that a copy of your letter and this reply will be forwarded to the Supreme Government, with a request that they will communicate the same to the family of the late Mr. Schlagintweit in Germany, and with a suggestion that your letter may be published in the *Calcutta Gazette*.

END OF VOL. II.

INDEX.

LIST OF PREVIOUS PUBLICATIONS OF MESSRS. DE SCHLAGINTWEIT.

A. BOOKS.

1. Untersuchungen über die physische Geographie der Alpen in ihren Beziehungen zu den Phänomen der Gletscher, zur Geologie, Meteorologie und Pflanzengeographie, von Hermann und Adolph Schlagintweit. Mit im Texte befindlichen Holzschnitten, Tafeln und Karten. Leipzig 1850, J. A. Barth. Thlr. 12 = £ 1 16 s.
(Researches on the physical geography of the Alps. Leipzig, 1850. Publisher: J. A. Barth.)
2. Neue Untersuchungen über die physische Geographie und die Geologie der Alpen von Adolph und Hermann Schlagintweit. Mit einem Atlas von XXII Tafeln. Leipzig 1854, T. O. Weigel Thlr. 22 = £ 3 6 s.
(New researches on the physical geography and geology of the Alps. With an Atlas. Leipzig, 1854. Publisher: T. O. Weigel.)
3. Épreuves des Cartes géographiques produites par la photographie d'après les reliefs du Monte Rosa et de la Zugspitze par Adolphe et Hermann Schlagintweit. Leipzig 1854, J. A. Barth. Thlr. 4 = £ - 12 s.
(Photographic maps taken from models of Monte Rosa and the Zugspitze. Leipzig, 1854. Publisher: J. A. Barth.)
4. Results of a Scientific Mission to India and High Asia. Undertaken between the years 1854 and 1858, by order of the Court of Directors of the Honourable East India Company. With an Atlas of Panoramas Views and Maps. Vol. I. Astronomical Determinations of Latitudes and Longitudes and Magnetic Observations during a Scientific Mission to India and High Asia, by Hermann, Adolphe, and Robert de Schlagintweit. Leipzig, 1861. F. A. Brockhaus Thlr. 26 $\frac{2}{3}$ = £ 4 0 s.

B. PLASTIC PUBLICATIONS.

1. Relief des Monte Rosa und seiner Umgebungen. Nach den Karten, Profilen und landschaftlichen Ansichten von Adolph und Hermann Schlagintweit. Im Massstabe von 1:50,000. Galvanisirter Zinkguss. Mit einem Erläuterungsblatte in Royal Folio als Beilage. Leipzig 1855, J. A. Barth. Thlr. 24 = £ 3 12 s.
(Galvanized model of Monte Rosa and its environs. With a map. Leipzig, 1855. Publisher: J. A. Barth.)

2. Relief der Gruppe der Zugspitze und des Wettersteines in den bayerischen Alpen. Nach equidistanten Horizontalen aufgenommen und ausgeführt von Adolph und Hermann Schlagintweit. Im Massstabe von 1:50,000. Galvanisirter Zinkguss. Mit einer geologischen Karte von Adolph Schlagintweit. Leipzig 1855, J. A. Barth. Thlr. 20 = £ 3 0 s.
 (Galvanized model of the Zugspitze and the Wetterstein, in the Bavarian Alps. With a geological map. Leipzig, 1855, J. A. Barth.)
- Metallic casts of Ethnographical Heads from India and High Asia, by Hermann, Adolphe, and Robert de Schlagintweit. This splendid collection, dedicated by permission to Her Majesty the Queen of England, consists of 275 facial casts and 37 casts of hands and feet, which have all been taken from living people. Publisher: J. A. Barth, Leipzig. Price of the entire series Thlr. 2348 = £ 350 4 s.

C. PHOTOGRAPHIC PUBLICATION.

- Stereoskopische Bilder nach den Schlagintweit'schen Reliefs daguéréotypirt im Massstabe von 1:400,000 der Natur. *a.* Der Monte Rosa und seine Umgebungen. *b.* Gruppe der Zugspitze und des Wettersteins. Leipzig 1855, J. A. Barth Thlr. 3 = £ — 9 s.
 (Stereoscopic views taken from plastic models; *a.* of Monte Rosa; *b.* of the Zugspitze. Leipzig, 1855. Publisher: J. A. Barth.)
